- The demand for fish in Malaysia is on an upward trend, and is expected to increase from 1.3 million metric tonnes in 2010 to 1.9 million metric tonnes in 2020.
- The per capita consumption is predicted to increase from 46 kg to 55 kg over the same period.
- The fishing industry has also contributed close to RM10.22 billion in 2015 and is envisaged to grow annually by 4.9% contributing close to RM 12.96 billion to the Malaysian economy by 2020.
- The industry is an important source of food for the nation, the demand for fish-based protein outstrips the supply generated by the local industry.
- To make up for the shortfall in demand, the country import fish and aquaculture from other countries in the region.

- Fish purse seine : **Commercial gears** in Sarawak
- **Demersal fish:** Largest part of marine catches
- **Pelagic fish:** Low catch - Low numbers of purse seiners operating in Sarawak (Witter *et al.*, 2015; Gambang *et al.*, 2003)
- **Fishing areas:** Offshore areas and productive fishing grounds (southern bays and in the north)
- **Purse Seine Designed:** Fine mesh & Coarser mesh
Vessel Size: 40 to 70 GRT **Gear Size:** 240 - 450m
- **Management measures for purse seine fishery:** Licensing and Regulations are provided and managed by the Head of Fisheries, located in Kuala Lumpur

- These measures were developed within the framework provided by the fisheries law, The Fisheries Act 1985 (Act 317). Among the main measures are →
 - Fishing Zones
 - Closed Fishing Area
 - Fishing Effort Control
 - Fishing Units Control
 - Port & At-Sea Control
 - Fishermen Registration
 - Marine Habitat Conservation
 - The Community-based Fisheries Management

Status of Pelagic Fish Stock

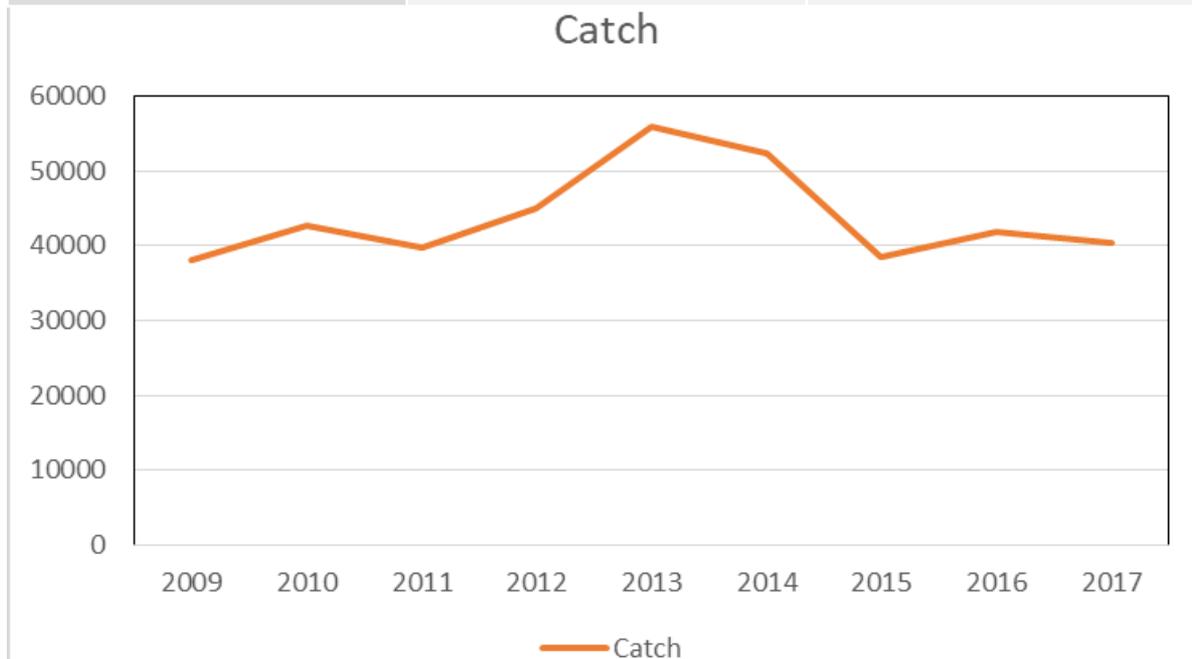

ITEMS	UNIT	2015
Area	km ²	150,627
Average Density (D)	tonnes/km ²	3.46
Total Biomass (Q)	MT	521,169
Current Yield (Y)	MT	46,777
Potential Yield (MSY)	MT	79,192
Surplus	MT	32,415

Status Analysis of Pelagic Fish Stock via Kobe Plot (2009-2017)

The table showed the landings and CPUE standardisation of pelagic fish from 3 types of gears (purse seine, trawl net and drift net) for the period of 2009-2017

CPUE & Landings
Standardisation

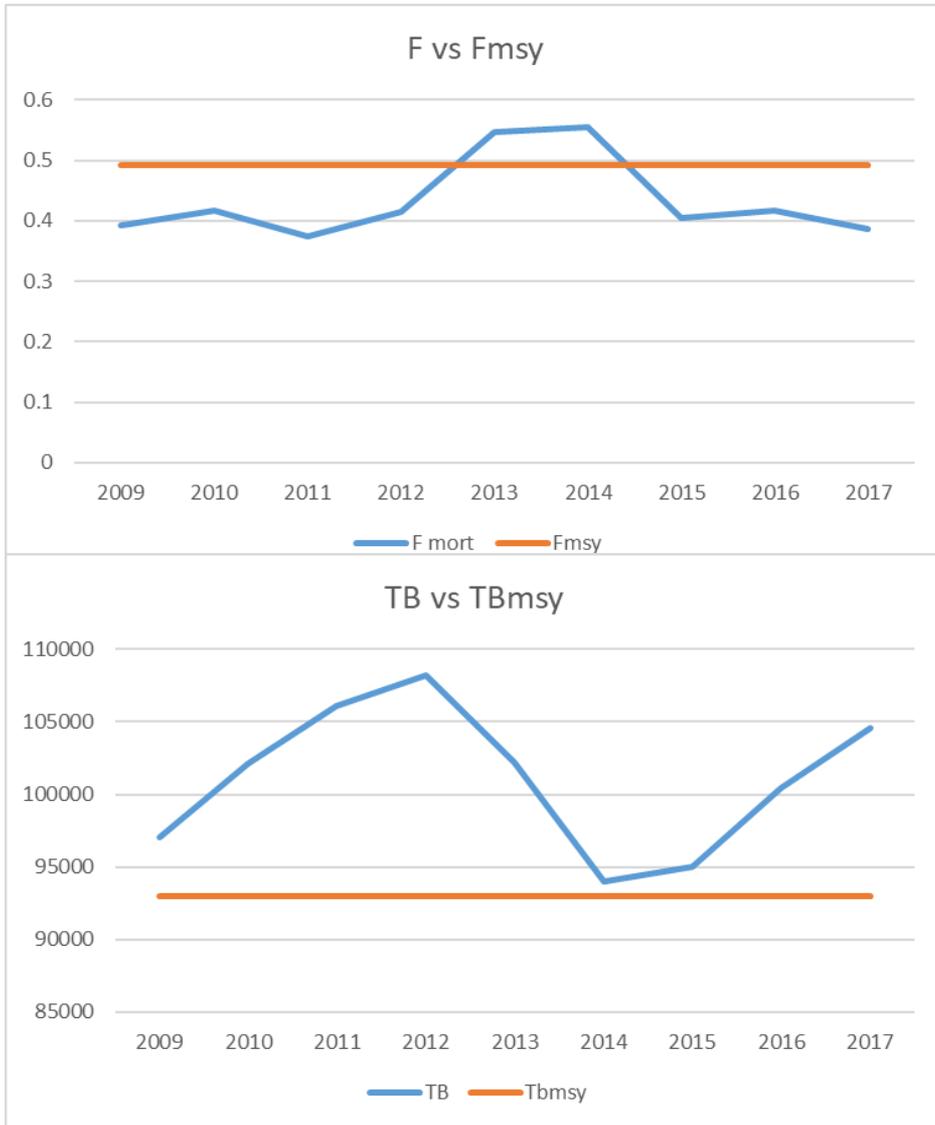

Year	CPUE STD	Catch
2009	2.81	38112
2010	2.87	42634
2011	2.95	39839
2012	2.85	45025
2013	3.54	55915
2014	3.72	52254
2015	3.20	38444
2016	3.06	41908
2017	2.97	40436

The graph showed the landings of pelagic fish in Sarawak waters for the period of 2009-2017

The value of F showed quite a distant from F_{msy} , therefore the amount of F could be increased for pelagic fishery

F **T**

Y

The graph showed the landings and the MSY line. The landings of pelagic fish was exceeding MSY in 2012-2014 and later started to decreased in 2015-2017.

The Kobe Plot revealed the status of pelagic fish in Sarawak for 2009-2017. The latest status of pelagic fishery is within the **GREEN** area

Based on risk assessment, the current catch level (40,263 tonnes, 3 years average in 2015-2017) can be increased by 14% to the MSY level (45,850 tonnes). Even when the catch is increased to MSY level, the probabilities violating MSY (TB & F) are less than 35% in 10 years (2027).

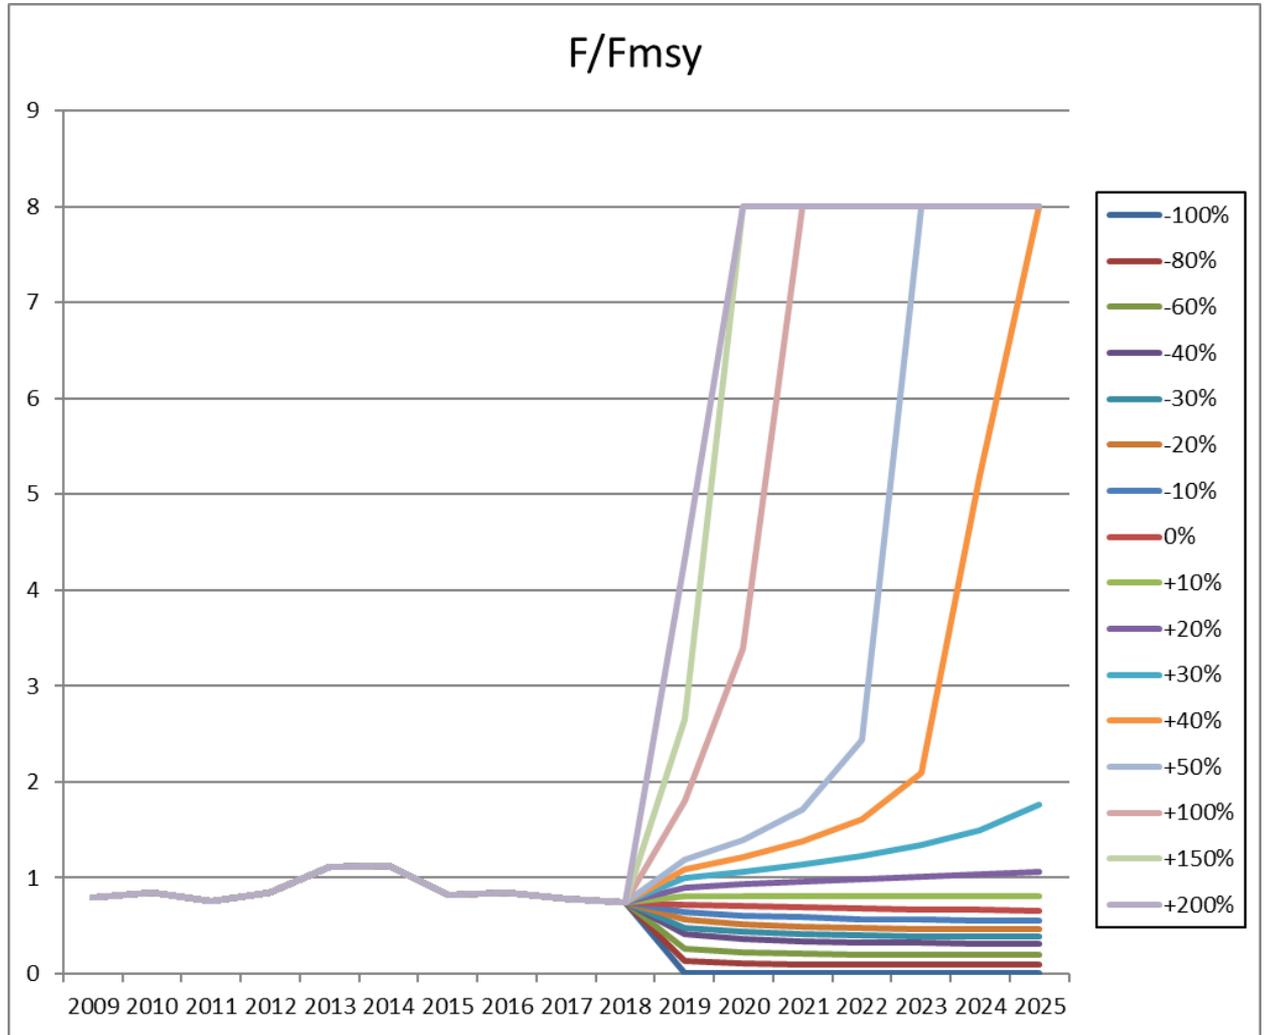

Color Legend										
Risk levels	Low risk		Medium low risk		Medium high risk		High risk			
Probably	0 - 20%		20 - 50%		50 - 80%		80 - 100			
	60%	70%	80%	90%	100%	110%	114%	120%	130%	140%
					Current catch (*)		MSY level			
10 catch scenarios (tons)	24,158	28,184	32,210	36,237	40,263	44,289	45,850	48,316	52,342	56,368
TB2020 < TBmsy	0	0	1	2	5	7	10	14	23	33
F2020 > F MSY	0	0	0	0	0	5	15	30	71	94
TB2027 < TBmsy	0	0	0	0	0	11	31	62	91	98
F2027 > F MSY	0	0	0	0	0	8	34	72	97	100

Note: (*)The current catch levels the average catch in 3 recent years (2015-2017)

The figure showed the status of landings and MSY for pelagic fish in Sarawak (in terms of total biomass)

1. Green Area (next 10 years) – if no increase in landings from 2017
2. Yellow Area (year 2021) – if 40% increase in landings from 2017
3. Overfishing (next 10 years) – if continuously increase in landings more than about 20%

Fishing Risk
 Killing
 our
 future
 generations
 and
 the
 environment

The figure showed the status of landings and MSY for pelagic fish in Sarawak (in terms of fishing mortality)

1. Green Area (next 10 years) – if no increase in F (same as 2017)
2. Yellow Area (year 2020) – if increase about 10% of landings from 2017

Existing Management Strategies

- Joint venture program, close season management is not yet applied due to Sarawak have more than enough available resource
- According to our latest survey in 2015 (Fisheries Resource Survey in Malaysian Waters 2013-2016), the surplus of production is 32,415 MT.
- Kobe plot analysis could be utilized to facilitate the pelagic fisheries management.
- According to the research in 2015 and the analysis via kobe plot until 2017, it is showed that the resources in Sarawak waters is underexploited. Therefore, the management could introduce a plan to increase the fishing effort with precautionary approach (eg: increase fishing vessels).
