## PREPARATION AND DISTRIBUTION OF THIS DOCUMENT

This Terminal Report of the Collaborative Project between CITES Secretariat and SEAFDEC (CITES Project No.: S-521) under EU-CITES implementation of decisions adapted by the $17^{\text {th }}$ meeting of the Conference of the Parties to CITES (CoP-17) - Sharks and Rays Data Collection in Southeast Asian Region (2015-2016) was prepared by the Southeast Asian Fisheries Development Center (SEAFDEC/SEC) in collaboration with the Marine Fisheries Resources Development and Management Department (SEAFDEC/MFRDMD). The publication is distributed to the SEAFDEC Member Countries, SEAFDEC Departments, and partner organizations represented during implementation of the Collaborative Project between CITES Secretariat and SEAFDEC.

## PART 1

## SUMMARY OF THE RESULTS (2015-2016)

Due to limitation of period for verifying data submitted from all participating countries within the project period of one-year, this regional report was prepared for submission to EU/CITES Secretariat as terminal report for the project implementation. As planned, the author will carry out data and information correction/verification with that of the national reports when appropriate in the near future.

## EXECUTIVE SUMMARY

A one-year study on sharks data collection had been implemented from year 2015 to 2016 in collaboration with six SEAFDEC Member Countries with technical support from SEAFDEC Marine Fishery Resources Development and Management Department (SEAFDEC/MFRDMD) and SEAFDEC Training Department (SEAFDEC/TD) under financial support mainly from CITES Secretariat and the Japanese Government. The Standard Operation Procedures (SOP) for Sharks, Rays and Skates Data Collection in the Southeast Asian Waters published by SEAFDEC was used as regional standard for collecting and reporting national data. Information on trade and marketing were also included in this study. Another study was conducted in Cambodia and Myanmar in 20182019.

During 2015-2016 study, from a total of 18,097 tons of fish landed in the participating countries during this study, it was found that catch composition of rays, sharks and skates were only $0.9 \%$, $1.4 \%$, and $0.1 \%$, respectively. It was recorded that the landing range from $0.6-5.15 \%$ for rays, $0.2-$ $20.7 \%$ for sharks, and $0.002-0.3 \%$ for skates. It should be noted that the landing of skates was recorded only in Myanmar and Viet Nam. A range of landing per month in the participating countries was $448-4,254 \mathrm{~kg}$ for rays, $364-16,445 \mathrm{~kg}$ for sharks, and $7-1,650 \mathrm{~kg}$ for skates, respectively. A total of 33,495 individual of rays, sharks and skates comprising of 18,546 rays, 13,504 sharks and 1,445 skates were sampled. Total number of species recorded under this study was 70 species of rays, 53 species of sharks, and 5 species of skates. The most abundant species (by number) were Telatrygon biasa for rays, Chiloscyllium punctatum for sharks, and Okamejei cairae for skates. The highest landing by weight was Mobula japonica ( $37,573 \mathrm{~kg}$ with size range from $32-100 \mathrm{~cm}$ DL) for rays, Alopias superciliosus ( $53,504 \mathrm{~kg}$ with size range from $65-366 \mathrm{~cm} \mathrm{TL}$ ) for shark, and Okamejei cairae ( $17,501 \mathrm{~kg}$, size range $10-58 \mathrm{~cm} \mathrm{TL}$ ) for skate.

Regarding fishing effort (CPUE, kg/haul), it was reported that CPUE of trawl fishing range from $0.002-1.46 \mathrm{~kg}$, and $0.003-1.023 \mathrm{~kg}$ for rays and sharks respectively. For gillnet, it was found that CPUE was from $0.008-19.5 \mathrm{~kg}$ for rays, and $0.005-11.82 \mathrm{~kg}$ for sharks. Catch per Unit Effort for longline was from $0.04-4.87 \mathrm{~kg}$ for rays, and $0.5-6.6 \mathrm{~kg}$ for sharks. For skates, CPUE was range from 0.01-2.3kg/haul only in trawl fishing.

Regarding the price and marketing of sharks, rays and skates, it range from 1-7.34 USD/kg for rays, 0.22-8.99 USD/kg for sharks, and 0.2-2 USD/kg for skates. The price varies pending on species, size and demand. Almost all sharks, rays, and skates was mainly utilized locally and some products were for foreign markets.

### 1.0 INTRODUCTION

Regional attempts have been made by SEAFDEC to assist the ASEAN Member States (AMSs) in improving the system of compiling their national statistics of sharks and rays through strengthening national expertise of the AMSs in identification and compilation of biological data on sharks and rays. Regional activities on sharks in Southeast Asia emphasized on improvement of data and information collection for commercially exploited aquatic species of sharks, starting from a series of events since 2011. In 2015, SEAFDEC has carried out a one-year regional project on sharks and rays data collection in six countries totally involving 13 landing sites of data collection. The Standard Operating Procedures (SOP) on Sharks Data Collection was developed under the Project to serve as guide and reference for enumerators from the participating countries during the sampling activities on data collection of sharks and rays. This project started with preparation of the SOP, and undertaking activities that include national workshops and training sessions on sharks and rays species identification for enumerators, recording of landing data at species level, validation of data, mid-term evaluation meeting for data collection, and final meeting to review national reports. SOP used during this studdy is as shown Appendix I.

### 1.1 Participating Countries and Financial Support

Six SEAFDEC Member Countries, namely Cambodia, Indonesia, Malaysia, Myanmar, Thailand, and Viet Nam, participated during 2015-2016 study and Cambodia and Myanmar continued in 20182019. Financial resources were mainly from SEAFDEC/EU-CITES (through CITES Secretariat) and Japanese Government through SEAFDEC under Japanese Trust Fund VI.

### 1.2 Period, National Appointed Technical Coordinator and Local Enumerators, and Methodology

One-year study of data collection at selected landing sites (Figure 1) was started from July in some counties and in August 2015 in other countries. The study were completed during the third quarter of 2016. For second phase, Myanmar started in August 2018 and completed in July 2019. Cambodia started in September 2018 and completed in August 2019. Participating countries collected all data by formally appointing local enumerators (Table 1) of their respective countries. In order to standardise all recorded data the regional standard - "Standard Operating Procedures for Sharks, Rays and Skates Data Collection (SOP) in the Southeast Asian Waters" developed by SEAFDEC were used. In addition to the landing data, information on marketing (trade and market chain with values) was also collected at several landing sites and wet markets during the study period.

At each landing site, 2-4 fishing vessels were selected for sampling. Sampling was conducted five (5) days a month. However. Sampling for Malaysia was conducted 12 days/month with financial support from government of Malaysia. Measurement of total length (TL) was taken for all shark, and disc length (DL) for all ray species except for species from families Rhinidae, Glaucostegidae, Rhinobatidae and Narcinidae. Measurement of total length was taken for these families as well as for skates. The length-weight of samples were individually measured with sampling size of about $10 \%$ of the total overall weight of catch of each vessel of sampling that day. The maturity stage for each individual was estimated according to Yano et al. (2005), and Ahmad and Annie Lim (2012). Total catch of all species as well as the total catch of other catches (fish, mollusk and
crustacean species) were also recorded for each sampling vessel. Pictures of specimens were taken for recording the general taxonomic and biological characteristics. Classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ahmad et al. (2013), Ahmad et al. (2014), Ebert et al. (2013), and Last et al. (2016). Numbers of landing sites, total number of landing sampled and type of fishing gears sampled are shown in Table 2. There are 13 landing sites in the participating countries. Data was from 4,394 landings and five (5) types of fishing gear.

## 2. 0 RESULTS

### 2.1 Species Composition (Table 3)

As shown in Table 3, a total of $18,097,240 \mathrm{~kg}$ of fish was landed during study period. Rays, sharks, and skates made up $169,364 \mathrm{~kg}, 249,259 \mathrm{~kg}$, and $19,896 \mathrm{~kg}(0.9 \%, 1.4 \%$, and $0.1 \%$ ) respectively. Total landing of other fishes were $17,658,720 \mathrm{~kg}$ ( $97.6 \%$ ). The highest catch composition of rays and sharks was reported by Indonesia at $5.2 \%$ and $20.7 \%$, respectively. Landings was ranged from 0.6-5.2\% for rays, 0.2-20.7\% for sharks and 0.002-0.35\% for skates. Landing of skates was recorded only in Myanmar and Viet Nam.

Table 4 shows the average landing per month. The landing was ranged from 448-4,254kg for rays, $364-16,445 \mathrm{~kg}$ for sharks, and $7-1,650 \mathrm{~kg}$ for skates. The highest average landings of ray was reported by Malaysia, Indonesia and Myanmar, and the highest average landings of shark was Indonesia, Malaysia and Viet Nam.

### 2.2 Sample Size

As shown in Table 5a, Table 5b, and Table 5c, a total of 33,495 individual comprising of 18,546 rays, 13,504 sharks and 1,445 skates were sampled. For the species that was clearly identified by national and regional shark experts, it was found that those comprised 63 species of rays (out of 78 species), 47 species of sharks (out of 60 species), and four (4) species of skates (out of 8 species). The most abundant ray species were Telatrygon biasa, followed by Brevitrygon heterura and Neotrygon orientalis. The most abundant shark species was Chiloscyllium punctatum, followed by Chiloscyllium hasseltii, and Carcharhinus albimarginatus. The most abundant skates species was Okamejei cairae.

### 2.3 Weight and Size Range of Sharks and Rays by Species

The highest landing by weight of rays was for Mobula japonica ( $37,573 \mathrm{~kg}$ with size range from $32-100 \mathrm{~cm}$ DL) followed by Urogymnus asperrimus ( $14,556 \mathrm{~kg}$, size range from $66-120 \mathrm{~cm} \mathrm{DL}$ ) and Brevitrygon heterura ( $10,212 \mathrm{~kg}$, size range $11-46 \mathrm{~cm}$ DL). The lowest was Temera hardwickii (about 1 kg , size 12.5 cm DL ). This species is considered as trash fish and rarely found at landing sites. Trash fish are sole separately from commercial species. The details are shown in Table 6a and Table 7a.

The highest landings by weight was for Alopias superciliosus $(53,504 \mathrm{~kg}$, size range from $65-366 \mathrm{~cm}$ TL ) followed by Alopias pelagicus ( $51,160 \mathrm{~kg}$, size range $162-338 \mathrm{~cm} \mathrm{TL}$ ) and Prionace glauca $(17,932 \mathrm{~kg}$, size range $142-295 \mathrm{~cm}$ TL). The lowest was Halaelurus buergeri ( 1 kg , size range $40-$ $45 \mathrm{TL})$. The details are shown in Table 6b and Table 7b.
Okamejei cairae ( $17,501 \mathrm{~kg}$, size range 10 to 58 cm DL) was the highest landing by weight among the skates, followed by Okamejei hollandi $(1,371 \mathrm{~kg}$, size range from 16.5 to 49 cm DL) and Okamejei cf boesemani ( $1,240 \mathrm{~kg}$, size range from 11 to 22.7 cm DL). See Table 6 c and Table 7 c for more information on all landing of skates by weight and size range of each skate species.

### 2.4 Fishing Effort and Catch Per Unit Effort (CPUE)

Summary of the fishing efforts and CPUE by type of fishing gear in each country are shown in Table 8. Fishing efforts and CPUE was compiled depending on the types of fishing gear from their sampling data. There are number of different parameters with regard to calculation of the fishing effort and CPUE for each type of fishing gear. Further data compilation is planned to take place soonest in close consultation among experts and countries' representatives.

The results indicate that CPUE (kg/haul or kg/operation) of trawl fishing for rays and sharks was ranged from $0.002-1.46 \mathrm{~kg}$, and $0.003-1.023 \mathrm{~kg}$ respectively. For gillnets, CPUE was from 0.008 19.5 kg for rays and $0.005-11.82 \mathrm{~kg}$ for sharks. CPUE for longlines was from $0.04-4.87 \mathrm{~kg}$ for rays, and $0.5-6.6 \mathrm{~kg}$ for sharks. Landings of skates only recorded in trawl nets and CPUE was ranged from $0.01-2.3 \mathrm{~kg}$.

### 2.5 Usage And Marketing

Table 9 shows price and marketing destinations of shark, ray and skate. Range of prices was from 1-7.34 USD/kg for rays, 0.22-8.99 USD/kg for sharks, and 0.2-2 USD/kg for skates. The price varies from species to species, its size and season. It was found that most of of sharks, rays and skates were consumed locally and some products sold to foreign countries.

### 3.0 CONCLUSION AND WAY FORWARD

The study were successfully implemented at 13 landing sites in six (6) countries namely Cambodia (one site), Indonesia, Myanmar, Thailand and Viet Nam (2 sites for each country), and Malaysia (4 sites). SEAFDEC also conducted the same study in the region in 2003-2004. Results from both studied will be used as a basis information for future planning on stock assessment of sharks and rays in the Southeast Asian region. Even though, all participating countries were able to submit the results some data need extra validation due to some taxonomy changes especially in scientific names of rays. It was recommended that capacity building program especially on identification of species (taxonomy) and analysis of data should be continued especially to junior researcher. In addition, data from this study also used to develop NPOA-Sharks in Thailand and Myanmar. Other countries such as Cambodia and Viet Nam will also develop their own NPOA-Sharks in future based on data collected from this study to support available national data collected from other research activities.

A. Standard Operation Procedure:

1. This form is for a single sampling vessel.
2. Collect all fish (sharks, skates and rays) if catch is less than 50 individuals or $10-50 \%$ of the landed catch if more than 50 individuals. Take samples randomly.
3. Separate them by species and sex.
4. Measure total length for all sharks, skates and rays from the Family Rhynchobatidae, Rhinobatidae, Narcinidae and Narkidae. Measure disc length for other ray species.
5. Record weight of all sharks, skates and rays by species.
6. Record weight of commercial and low-value species.
B. Measurement of sample (Sharks)

### 1.0 INTRODUCTION

Cambodia has 435 km coastlines in the Gulf of Thailand, which is stretched between Vietnamese borders in the south to Thailand border in the west. There are four (4) provinces located along this coastline namely, Koh Kong ( 237 Km ), Preah Sihanouk ( 105 Km ), Kampot ( 67 Km ), and Kep ( 26 Km ) provinces. There are 525 species of marine finfish, 20 species of marine crabs, 42 species of marine gastropods, 24 species of marine bivalves, and 11 species of marine mammals (Tana 1997, Try 2003). Furthermore, Cambodia has her own Exclusive Economic Zone (EEZ), the area extended from the shoreline to 200 nautical miles, which covers $55,600 \mathrm{Km}^{2}$. Marine fisheries of Cambodia are pelagic due to the physical feature of the EEZs area (Maximum depth is not deeper than 80 meters), and their productivity covers around $20 \%$ of national fish production. The introduction of modern fishing technologies appeared around the 1958's.

Fishing practices in Cambodia can be classified into three (3) types namely small-scale, family fisheries medium-scale and commercial-scale. The middle-scale and commercial-scale fisheries refer to those fishing activities that have highly efficient fishing gears and can go both inshore and offshore using all fishing gears with exception of trawling in inshore waters. The official fisheries statistic of the Fisheries Administration has not been categorized by species but by higher taxonomy such as fish, shrimp, ray, squid, crab, snail and mussels. In general, small pelagic fish have been classified by species (short mackerel and Indian mackerel), based on groups of fish (round scads); and other groups of fish by market size, while the pelagic fish size was not fit into the market size that was considered as trash fish. These species are usually caught by long-tailed boats applied with gill nets, and purse seine net vessels either in shallow or deep waters.

Additionally, SEAFDEC started to support Sharks/Rays data collection and data analysis for one year, beginning from September 2015 to August 2016.

### 1.1 Objective

The objectives of this study were:

- To enhance human resource development in elasmobranchs taxonomy, and
- To improve landing data recording from generic 'Sharks' and 'Rays' to species level.

### 1.2 Data Collection at Landing Sites

Preah Sihanouk Province is a major landing area for sharks and rays

### 1.2.1 Selection of Study Sites (Tomnup Rolork BEP Jetty)

Tomnup Rolork, Phum III, Sangkat I Preah Sihanouk City in Sihanouk Province consists of four (4) main landing areas that were selected as the project sites. BEP Jetty was selected for data collection. This landing site is own by a private company. Most sharks and rays landings were from trawlers, long lines, and purse seines. The trawler was selected as the representative gear for data collection. The project sites are shown in Figure 1 and Figure 2.

Figure 1: Ariel View of Sihanoukville Fishing Port

Figure 2: Map of Sihanoukville

### 1.2.2 Fishery Structure and Background of Study Sites

Preah Sihanouk is one of the major provinces where comprises more landing sites for sharks and rays among the coastal provinces of Cambodia. All jetties belong to private companies. The major gear was trawl nets. Numbers of the crews working on boat depend on the size of the vessel which ranges from 3-8 crew members. Almost all sharks and rays were landed by trawlers. The fishing ground was $8-57$ nautical miles ( nm ) from the coastline with $8-25 \mathrm{~m}$ depth (Table 1). Fishing operations were between 1-15 days per trip and fishing operations were 3-4 hauls per day. All catches were landed from 06.00-10.00 a.m.

Table 1: Number of Licensed Fishing Vessels and Number of Fishers

| Type of <br> Gear | Fishing Ground | Fishing Operation <br> (From Coastline) | No of Boat | No of Fisher |
| :---: | :--- | :---: | :---: | :---: |
| $20-50$ GRT | Koh Dek Kol | $8-11 \mathrm{~nm}$ | 4 | 40 |
| $70-90$ GRT | Koh Pring | $46-57 \mathrm{~nm}$ | 33 | 343 |

| $20-80$ GRT | Koh Rong | $13-40 \mathrm{~nm}$ | 35 | 378 |
| $20-50$ GRT | Koh Sdach | $25-28 \mathrm{~nm}$ | 9 | 96 |
| 24 GRT | North Koh Dek Kol | 12 nm | 2 | 21 |
| 50-90 GRT | Koh Tang | $34-56 \mathrm{~nm}$ | 67 | 710 |
| $14-60$ GRT | North Koh Rong | $16-32 \mathrm{~nm}$ | 4 | 31 |
| TOTAL |  |  | 179 | 1,875 |

### 1.3 Appointment of Enumerators

Mr. Ly Seyha, a Fisheries Officer from Marine Aquaculture Research and Development Center (MARDeC) was appointed as an enumerator. His contact detail is as follow:

Mr. Ly Seyha<br>Acting Chief of Aquaculture Technology Feed and Water Quality<br>Group 12, Village 3, Sangkat 1, Preah Sihanouk Town,<br>Preah Sihanouk Province

### 1.4 Materials and Methods

### 1.4.1 Sampling Methods

The sampling activity started from 10 September 2015 until 12 August 2016. The enumerator was requested to record landings data and other related information using a standard form at least five days/month. A standard operating procedure (SOPs) entitled 'Standard Operating Procedures Sharks and Rays Data Collection in the Southeast Asian Waters' was used as a major reference. The content included standard operation procedures and instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of the enumerator, name of the landing site, date of sampling, vessel registration number, vessel GRT, fishing area, the price at landing sites, name of species (common name and scientific name), the total catch of sharks, rays, commercial and low-value species from each sampling vessel. The data were compiled in excel and submitted to the respective sharks and rays Cambodia focal point before submitted to SEAFDEC every month for verification. The data were analysed at the end of the month.

### 1.4.2 Selection of Fishing Vessels and Sampling Activities

Between 2-3 fishing vessels were selected for sampling each day for five days per month at the landing site. Measurement of Total Length (TL) was taken for all sharks and Disc Length (DL) for rays. All shark and ray specimens sampled were measured and weighed individually. The maturity stage for each individual was estimated according to Yano et al. (2005), and Ahmad and Annie Lim (2012). The total catch of all sharks and rays by species as well as the total catch of commercial and low-value species were also recorded for each sampling vessel. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3 Classification

The classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ebert et al. (2013), Ahmad et al. (2013), Ahmad et al. (2014) and Last et al. (2016).

### 2.0 RESULTS

### 2.1 BEP Jetty

### 2.1.1 Landing Samples

This site is the largest landing site in this province and many types of fishing vessels landed their catch. A total of 179 trawlers were sampled during the study period. The highest gear type was 116 of the trawl net commercial scale. The numbers of landing samples per month were 15 except in September 2015 only 14. The details are shown in Table 2.

### 2.1.2 Fishing Ground and Catch Composition

The main gear landing sharks and rays was trawl nets commercial scale at $10,536 \mathrm{~kg}(75.8 \%)$ comprising $3,994.4 \mathrm{~kg}$ of rays and $6,541.6 \mathrm{~kg}$ of sharks. While the trawl net of medium scale contributed 870 kg of rays and $1,386.3$ of sharks and trawl net small scale contributed 515.2 kg of rays and 599.6 kg of shark. Koh Tang was the main fishing ground situated $34-56 \mathrm{~nm}$ from the coastline. The highest landing of rays by month was from trawl net commercial scale at 774.0 kg in February 2016, followed by 536.0 kg in January 2016. While, the highest landing of sharks by month was from trawl net commercial scale at $1,108.0 \mathrm{~kg}$ in December 2015, followed by $1,056.0$ kg in February 2016. The details are shown in Table 3.

### 2.1.3 Sharks and Rays Composition

A total of $910,313.0 \mathrm{~kg}$ of sharks and rays was landed from BEP jetty during the study period. Sharks and rays made up $8,527.4 \mathrm{~kg}$ and $5,379.6 \mathrm{~kg}(0.9 \%$ and $0.6 \%)$ from the total landing respectively. While landings of bony fish and others were $896,406.0 \mathrm{~kg}$ ( $98.5 \%$ ). Average landings per month for sharks and rays were 710.6 kg and 448.3 kg , respectively. The highest landing by month for rays was 963.0 kg in February 2016, followed by 612.0 kg in January 2016 and 577.0 kg in March 2016. However, the highest landing for sharks was $1,309.0 \mathrm{~kg}$ in February 2016 followed by $1,146.0 \mathrm{~kg}$ in December 2015 and 934.0 kg in March. In general, the landing of sharks and rays ranged between $0.5-1.6 \%$ and $0.3-1.2 \%$, respectively from total landing. The details are shown in Table 4.

### 2.1.4 Sample Size

A total of 1,876 sharks and rays which comprise 919 sharks and 957 rays were sampled comprising six (6) species of rays and five (5) species of sharks. The most abundant ray species by number was Brevitrygon heterura followed by Brevitrygon imbricata and Telatrygon biasa. The highest number of rays sampled by month was 99 in October 2015 followed by 98 in November 2015 and 84 in December 2015. The most abundant shark species was Chiloscyllium punctatum (710 tails) while the scarce species was Carcharhinus leucas ( 5 tails). The highest number of sharks sampled by month was 93 in November 2015, followed by 85 in December 2015 and 84 in October 2015. The most common ray species were Brevitrygon heterura followed by Brevitrygon imbricata and Telatrygon biasa, while the most common shark species were Chiloscyllium punctatum and Atelomycterus marmoratus. All these species were landed all year around. Other species, Aetobatus ocellatus, Taeniura lymma, Carcharhinus sorrah, Carcharhinus leucas, and Carcharhinus melanopterus were rarely landed during the study period (Table 5).

### 2.1.5 Weight of Sharks and Rays by Species

A total of $1,3907.0 \mathrm{~kg}$ was landed from the BEP landing site comprising $8,527.4 \mathrm{~kg}$ sharks and 537.6 kg rays. For Rays, the highest landing by weight was from Brevitrygon heterura amounting to $1,905.9 \mathrm{~kg}$, followed by $1,247.5 \mathrm{~kg}$ Brevitrygon imbricata and $1,059.0 \mathrm{~kg}$ Telatrygon biasa. The highest landing by month was 266.0 kg for Brevitrygon heterura in July 2016 followed by 235.2 kg in June 2016 and 207.6 kg in December 2015. Weight of other rays species ranged between $14.2-207.1 \mathrm{~kg}$. For the sharks, the highest landing by weight was from Chiloscyllium punctatum amounting to $7,282.2 \mathrm{~kg}$, followed by 878.8 kg Atelomycterus marmoratus, and 237.2 kg Carcharhinus sorrah. The highest landing by month was $1,171.9 \mathrm{~kg}$ for Chiloscyllium punctatum in February 2016 followed by $1,083.35 \mathrm{~kg}$ in December 2015 and 77.1 kg in March 2016. Weight of other shark species ranged between $3.4-281.1 \mathrm{~kg}$. The details are shown in Table 6.

### 2.1.6 Size Range of Sharks and Rays

Most of the ray species that were sampled from September 2015 to August 2016 were mature except Aetobatus ocellatus and Taeniura lymma. The size of Aetobatus ocellatus ranged between $84.0-90.0 \mathrm{~cm}$ disc lengths. First maturing size for Hemitrygon parvonigra about 19.0 cm disc length, Telatrygon biasa about 18.0-22.0 cm disc length, Brevitrygon imbricata about $18.0-21.0 \mathrm{~cm}$ disc length, and Brevitrygon heterura about 17.0-20.0 cm disc length. All these ray species were caught under the mature stage at 12 cm disc length for Hemitrygon parvonigra in September 2015, 13 cm disc length for Telatrygon biasa and Brevitrygon imbricata in September and October 2015, 11.6 cm disc length for Brevitrygon heterura in October 2015. Most of the sharks' species landed were mature except for Carcharhinus sorrah and Carcharhinus melanopterus. The first maturing sizes of Atelomycterus marmoratus, Carcharhinus leucas, and Chiloscyllium punctatum are $40.0 \mathrm{~cm}, 70.0$ cm , and 50.0 cm total length, respectively. For shark species, the only Chiloscyllium punctatum was caught under the adult stage at 28.5 cm in September 2015, 19.5 cm in October, 18.0 cm in December 2015, 29.0 cm in January 2016, and 12 cm in March 2016. The sizes range of all sharks and rays species from September 2015 to August 2016 are shown in Table 7A and Table 7B.
Table 7A: Size Range of Sharks (Total Length) and Rays (Disc Length) from September 2015-February 2016, All Measurements in cm.

### 2.1.7. Fishing Effort and CPUE (Catch per Unit Effort)

Trawl net fishing gear for sharks and rays divided by three types: 1) Trawl Net Commercial Scale, 2) Trawl Net Medium Scale, and 3) Trawl Net Small Scale. Data collection of trawl boats was collected randomly. In actual practice, the trawl net commercial scale found more numbers $(1,351)$ compared to medium (310) and small (121) scales. The data of trawl net samples from September 2015 to August 2016 were used to calculated catch per unit effort (CPUE) as follows: The days at operation by trawl net 1,351 days ( 5,404 hauls). The detail is shown in Table 8A and $\mathbf{8 B}$.

Table 8A: Days at Operation by Gears Sampled during the Study Period 2015-2016

| Type of Gear | 2015 |  |  |  | 2016 |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug |  |
| Trawl Net Comercial Scale | 18 | 32 | 132 | 175 | 150 | 153 | 54 | 127 | 124 | 129 | 133 | 124 | 1,351 |
| Trawl Net Medium Scale | 55 | 45 |  |  |  | 22 | 69 | 22 | 17 | 13 | 16 | 51 | 310 |
| Trawl Net Small Scale | 22 | 23 | 14 | 8 | 13 | 3 | 8 |  | 8 | 16 |  | 6 | 121 |
| Grand Total | 95 | 100 | 146 | 183 | 163 | 178 | 131 | 149 | 149 | 158 | 149 | 181 | 1,782 |

Table 8B: Number of Operation during the Study Period

| Type of <br> Gear | 2015 |  |  |  | 2016 |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug |  |
| Trawl Net | 380 | 400 | 584 | 732 | 652 | 712 | 524 | 596 | 596 | 632 | 596 | 724 | 7,128 |

The CPUE of rays by trawl net range between $0.01-1.07 \mathrm{~kg} / \mathrm{day}$ at operation, $0.00-0.27 \mathrm{~kg} /$ number of operation, and $0.02-3.15 \mathrm{~kg} /$ swept area $\left(\mathrm{km}^{2}\right)$. The highest CPUE of rays from the trawl net was Brevitrygon heterura with $1.07 \mathrm{~kg} /$ day at operation $(0.27 \mathrm{~kg} / \mathrm{number}$ of operation and 3.15 $\mathrm{kg} /$ swept area $\left.\left(\mathrm{km}^{2}\right)\right)$. The details are shown in Table 9A.

The CPUE of sharks by trawl net range between $0.04-4.09 \mathrm{~kg} /$ day at operation, $0.01-1.02 \mathrm{~kg} /$ number of operation, and $0.11-12.05 \mathrm{~kg} / \mathrm{swept}$ area $\left(\mathrm{km}^{2}\right)$. The highest CPUE of shark from trawl net was Chiloscyllium punctatum with $4.09 \mathrm{~kg} /$ day at operation ( $1.02 \mathrm{~kg} / \mathrm{number}$ of operation and $12.05 \mathrm{~kg} /$ swept area $\left(\mathrm{km}^{2}\right)$ ). The details are shown in Table 9B.

Table 9A: CPUE Rays Species Captured by Trawl Net

| Rank | Rays Species | Total weight (kg) <br> Ray by Species | CPUE <br> (kg/Days at <br> Operation) | CPUE <br> (kg/ Number <br> of Operation) | CPUE (kg/ <br> Swept area <br> (Km2) |

| 5 | Atelomycterus marmoratus | 878.77 | 0.49 | 0.12 | 1.45 |

### 2.1.8 Usage and Marketing

Marketing information collected at this landing site revealed that most sharks and rays were consumed locally and some were exported to Viet Nam. The major market of local consumption was Phnom Penh Capital City. The price varied not much among the six (6) species. The most expensive rays are Brevitrygon imbricata and Brevitrygon heterura. They were sold around 1.5-3.2 USD/kg followed by Taeniura lymma around 1-3 USD/kg, and Aetobatus ocellatus around 1.5-2.5 USD/kg. The other rays species, Hemitrygon parvonigra and Telatrygon biasa price ranged from 1-2.5 USD/kg. In general, bigger size rays were more expensive than smaller ones.

Smaller size sharks with a total weight of fewer than 3 tails $/ \mathrm{kg}$, were sold locally at 2 USD/kg. The most expensive sharks Carcharhinus sorrah was at 2.5-4 USD/kg followed by Carcharhinus melanopterus selling at 2.5-4 USD/kg, Carcharhinus leucas at 2-4 USD/kg, and Atelomycterus marmoratus at 1.75-3.75 USD/kg. The cheapest price was Carcharhinus punctatum at 1.75-3.3 USD/kg. Market destinations for sharks and rays were the same.

Normally the suppliers use trucks to deliver sharks and rays to the other markets for local consumption in the morning after landed. However, some sharks and rays were exported to Viet Nam by land and ships (cargo vessels). The price of the exported products was higher than the local markets. Both of the sharks and rays were sold between UDS $3-4 / \mathrm{kg}$. The details are shown in Table 10.

Table 10: Price of Sharks and Rays by Species at the Landing Site, All Prices in USD per Kilogram.

| Rays Species | Price/kg/USD | Part | Marketing |
| :--- | :--- | :--- | :--- |
| Aetobatus ocellatus | $1.5-2.5$ | Whold Body | Local, Phnom Penh and to VN |
| Hemitrygon parvonigra | $1-2.5$ | Whold Body | Local, Phnom Penh and to VN |
| Telatrygon biasa | $1-2.5$ | Whold Body | Local, Phnom Penh and to VN |
| Brevitrygon imbricata | $1.5-3.2$ | Whold Body | Local, Phnom Penh and to VN |
| Brevitrygon heterura | $1.5-3.2$ | Whold Body | Local, Phnom Penh and to VN |
| Taeniura Iymma | $1-3$ | Whold Body | Local, Phnom Penh and to VN |
| Sharks Species |  |  |  |
| Atelomycterus marmoratus | $1.75-3.75$ | Whold Body | Local, Phnom Penh and to VN |
| Carcharhinus leucas | $2-4$ | Whold Body | Local, Phnom Penh and to VN |
| Carcharhinus melanopterus | $2.5-4$ | Whold Body | Local, Phnom Penh and to VN |
| Carcharhinus sorrah | $2.5-3.75$ | Whold Body | Local, Phnom Penh and to VN |
| Chiloscyllium punctatum | $1.75-3.3$ | Whold Body | Local, Phnom Penh and to VN |

### 3.0 CONCLUSION

A pilot project on recording landing data of sharks and rays up to species level was conducted in Tumnup Rolok of Preah Sihanouk province. During this project, three (3) officers of Marine Aquaculture Research and Development Center (MARDeC), and one (1) officer of Kampong Som Fisheries Administration Cantonment were trained in taxonomy and data collection using the new harmonized format. One landing site (jetty) namely BEP was selected as the study site as it was the main landing site of sharks and rays in the province.

A total of five species of sharks from two Orders and three Families; and six species of rays from one Order and two Families were recorded. Details are shown in Appendix I. In terms of the percentage of total marine landings, sharks and rays only contributed $0.9 \%$ and $0.60 \%$ in Preah Sihanouk province. These figures confirmed earlier data as published in Cambodian National Statistics that sharks were by-catch and was not targeted. However, the rays were not recorded in the Cambodia National Statistics.

The most abundant among sharks species was Chiloscyllium punctatum and for rays species was Brevitrygon heterura. The most common sharks species were Atelomycterus marmoratus and Chiloscyllium punctatum, while rays were Aetobatus ocellatus, Brevitrygon imbricata, Telatrygon biasa, and Hemitrygon parvonigra. The size of sharks which more than 103 centimeters in total length were Chiloscyllium punctatum and the medium sized sharks were Carcharhinus sorrah and Carcharhinus leucas was rarely caught due to nature of the fishing area and gear used. Sharks and rays production distributed to domestic consumption and exportation.

### 4.0 OUTPUT AND OUTCOME

The project outputs and outcomes are summarised in Table 11 as shown below.

Table 11: Output and Outcome

| No | Output | Outcome |
| :---: | :--- | :--- |
| 1. | Four trained personnel in sharks and <br> rays taxonomy from the Department of <br> Fisheries Malaysia. | Trained staffs are now able to make the right and <br> valid identification of species. Training materials <br> stored electronically and easy to excess. |
| 2. | Astandardised formatfor data collection <br> for national activity produced. | Improved technique of data collection for <br> implementation at the national level |
| 3. | Detailed informationonthe percentages <br> of sharks and rays from the total landing <br> at the pilot project site. | Confirmed earlier data published in Cambodian <br> National Statistics. Sharks and rays were not <br> targeted. |
| 4. | Information on the relative dominance <br> of the different species of sharks and <br> rays obtained. | Increased awareness of needs and measures for <br> shark conservation and management of specific <br> species. |
| 5. | Information on the monthly fluctuation <br> of the different species of sharks and <br> rays obtained. | Trends of landings by species analysed for <br> national level management. |
| 6. | Information on usage and marketing <br> of the landed sharks and rays were <br> obtained from the pilot project. | Sharks and rays are landed whole, fully utilised <br> with no finning activities onboard vessels. |
| 7. | A report on the landing of sharks and <br> rays up to species level from Tomnup <br> Rolork. | Information sharing to Fishery Stakeholders. |
| 8. | Issues and problems arising from this <br> activity identified and improvements <br> made especially with the data collection <br> format | Development of a comprehensive national data <br> collection system for sharks and rays as part of <br> the National Plan of Action Sharks |

### 5.0 FUTURE ACTIVITIES

Cambodia will expand to another two landing sites for recording data of sharks and rays at the species level in Koh Kong and Kampot Provinces in 2017. Data collection at the current site will be retained. An awareness-raising program will be conducted in other coastal provinces of Cambodia.

### 1.0 INTRODUCTION

Indonesian waters have a high diversity of sharks and rays, with at least 118 species belonging to 25 families of sharks and 106 species belonging to 19 families of rays found throughout the vast archipelago (Dharmadi et al. 2015). In general, the most common shark species found in Indian Ocean was Carcharhinus falciformis, and the dominant families were Carcharhinidae and Squalidae (Dharmadi et al. 2012). FAO data indicate that Indonesia is the world's largest shark producer (Lack \& Sant, 2009), contributing around 12.3\% of total world production. However, shark production in Indonesia only contributes about $2 \%$ of the total marine fishery production. Over the past several decades, national shark production has declined by $28.3 \%$, from 68,366 in 2000 to 49,020 in 2014 (DGCF, 2015). Shark fishing activities in Indonesia mostly occurred as a by-catch ( $72 \%$ ) and only $28 \%$ were targeted fishery (Zainuddin, 2011). Shark fishing ground is in the Indian Ocean. Most sharks landed in Indonesia are bycatch in artisanal fisheries using various types of fishing gear, such as gillnets, longlines, seine-nets and bottom trawlnets (Fahmi and Dharmadi 2013). Tuna fisheries, whether using longlines or gillnets, also frequently catch sharks as incidental bycatch (Dharmadi and Fahmi 2003; Fahmi and Dharmadi 2013). Various parts of shark were utilized such as their meat and fins for food, skins for leather industries, liver for oil and cartilages for medicines. The most valuable part of the shark body is its fins. Most fins are exported to Asian countries (Anon, 2003), and also to European countries.

The high price of shark fins in the international market has led to sustained, intensive, shark fishing activities, which, if not controlled, will continue to pose a serious threat to the conservation of shark resources in Indonesian waters. Sharks have the potential to be exploited sustainably if carefully managed (Walker 1998). However, many sharks species are vulnerable to over exploitation (and even extinction) due to their slow growth, late maturity (of the order of decades for some species) and low fecundity (Last and Stevens, 2012).

### 1.1 Objective

The objectives of this project were:

- to enhance human resource development in elasmobranchs taxonomy, and
- to improve landing data recording from generic 'sharks' and 'rays' to species level.

### 1.2 Data Collection at Landing Sites

### 1.2.1 Selection of Study Sites

Cilacap has two landing sites; Pelabuhan Perikanan Cilacap (PPC) and Sentolo Kawat. PPC is the main fish-landing site in Cilacap, and most of large vessels are landed here. Whiles Sentolo Kawat is a smaller landing site, and only a few vessels landing here. Gillnets, trammel nets and longlines are the most common fishing gears which applied to catch sharks and rays in Cilacap. However, most of sharks were caught as bycatch in the gillnets and tuna longlines fisheries. There are also surface longlines to catch shark as a target fishery at Sentolo Kawat operated by fishermen from east Java.

Lampulo Fishing Port is a medium-sized port on the north coast of Banda Aceh with a diverse range of gears such as purse seines, set longlines, and hand lines. This landing site is the biggest landing for sharks in Banda Aceh that are caught in the West Sumatera waters in the Indian Ocean. There are three types of fishing gear used to catch sharks as by-catch i.e. drift long line/ surface longline, drift gillnet, and deep/bottom longlines. Surface longlines are the most common gear used by fishermen based at Lampulo Fishing Port and are employed to catch pelagic sharks. Based on fisheries statistics, shark production landed at Lampulo Fishing Port is less then 5\% of the total landing of marine fishes. The location of all landing sites are shown in Fig. 1.

Figure 1: Location of Study Sites at Lampulo and Cilacap

### 1.2.2 Fishery Structure and Background of Study Sites

### 1.2.2.1 Cilacap Fish Landing Site

Cilacap is the biggest landing site of sharks and rays at Central Java. The major gears were drift gillnet (155), followed by surface longline (31), and bottom gillnet (11). All drift gillnets, surface longline, and bottom gillnet are normally operated by $10-12$ crew members. Almost all of the sharks and rays were landed by drift gillnet and surface longline operating between 8-121 nm from the coastline, while for the bottom gillnet between 1-10 nm. Fishing operation normally between 7-30 days per trip for drift gillnet, 10-20 days per trip for surface longline, and 12-15 days per trip for bottom gillnet. All catches were landed from 08.00-10.00am. The details of fishing vessels registered in this district are shown in Table 1.

Table 1: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Cilacap

| Type of Gear | Fishing zone | Fishing operation <br> (from coastline) | No. of <br> vessels | No. of <br> fishers/crews |

### 1.2.2.2 Lampulo Fish Landing Site

Lampulo is a medium-sized port on the north coast of Banda Aceh with a diverse range of gears including purse seines, set longlines, and hand lines. The major gears were bottom longlines (22), followed by purse seiners (15), hand lines (13), and shark longlines (9). The details of the fishing vessels registered in this district are shown in Table 2. The major gears landing sharks and rays were longlines, purse seines, and hand line. All longlines are normally operated by 4-5 crew members. However, the number of crew for traditional gears such as gillnets and longlines was normally $2-4$ and 4-6 respectively. The fishing operation for longlines was normally between 3-7 days per trip while gill nets were normally 8-9 days per trip. All catches were landed from 07.30am - 12.00noon.

### 1.3 Appointment of Enumerators

Two Assistant Fisheries Officers from the State Fisheries Office of Cilacap and Lampulo were appointed as enumerators. Their names and addresses are as follows:

1. Mr. Agung Ferieigha Nugroho

Pelabuhan Perikanan Samudera Cilacap
Jalan Lingkar Pantai Teluk Penyu, Cilacap-Central Java
2. Mr. Munawir

Pelabuhan Perikanan Nusantara Lampulo
Jalan Ateuk Jawo Lr. Tanggul Gampong Ateuk Jawo Banda Aceh

### 1.4 Materials and Methods

### 1.4.1 Sampling Methods

The sampling activity started in August 2015 until 15 July 2016. All enumerators were requested to record landing data and other related information in a standard form at least 5 days/month. A standard operating procedures (SOPs) entitled 'Standard Operating Procedures Sharks and Rays Data Collection in the Southeast Asian Waters' was used as a major reference. The content included Standard Operation Procedure and instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of enumerator, name of landing site, date of sampling, vessel registration number, vessel GRT, fishing area, price at landing sites, name of species (common name and scientific name), total catch of sharks, rays, commercial and low-value species from each sampling vessel. The completed data in excel were then submitted to the respective National Coordinator in Indonesia before submitted to SEAFDEC/ MFRDMD and SEAFDEC Secretariat before second week of the following month for verification. The data were analysed at the end of each quarter.

### 1.4.2 Selection of Fishing Vessels and Sampling Activities

Between 1-3 fishing vessels were selected for sampling each day for five days per month at each landing site. Measurement of Total length (TL) were taken for all skates, sharks species and rays from Families Rhinidae, Glaucostegidae, Rhinobatidae, Narcinidae and Narkidae. While Disc Length (DL) were taken for all ray species where the tail is frequently absent or damaged (mainly from the Families Dasyatidae, Gymnuridae and Mobulidae). All sharks and rays specimens were measured and weighed individually if the total number was less than 50 tails per vessel. If the total number was more than 50 tails, only $10-50 \%$ were measured. The maturity stage for each individual was estimated according to Yano et al. (2005) and Ahmad and Annie Lim (2012). The total catch of all sharks and rays by species as well as the total catch of commercial and low-value species were also recorded for each sampling vessel. Some samples were brought back to the Fisheries Laboratory at Cilacap and Lampulo and preserved for future reference. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3 Classification

The classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ahmad et al. (2013) and Ahmad et al. (2014), Ebert et al. (2013)and Last et al. (2016)

### 2.0 RESULTS

### 2.1. Cilacap and Lampulo Fish Landing Sites

### 2.1.1 Landing Samples

A total of 168 landings were sampled during the study period at Cilacap. The highest by month was 43 landings in September and 34 landings in October 2015. The highest landings by gear type was 113 for drift gillnet followed by 44 and 11 for longline and bottom gillnet, respectively (Table 3). A total of 107 landings were sampled during the study period at Lampulo. The highest by month was 15 landings in October 2015 and June 2016 and 12 landings in September, respectively. The highest landings by shark longline gear type was 41 of Indian ocean followed by 34 landings of purse seine and 25 landings from handline (Table 4).

### 2.1.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks and rays at Cilacap was the bottom gillnet, drift gillnet and longline. The total catch was $231,196.5 \mathrm{~kg}$ kg comprising $187,321 \mathrm{~kg}$ sharks ( $81.0 \%$ ) and $43,875.5 \mathrm{~kg}$ rays ( $19.0 \%$ ). Those fishing gears operated from the inshore to offshore the Indian Ocean. The highest landing of sharks by month was $26,794 \mathrm{~kg}$ in September while the highest landing of rays was $12,734 \mathrm{~kg}$ in October (Table 5).

Longline was the main gear at Lampulo with $6,991 \mathrm{~kg}$ landings for sharks, $2,002.9 \mathrm{~kg}$ of rays, and 8.0 kg of skates. Most longlines operated beyond 94 nm from the coastline. Fishing ground is in Indian Ocean. The highest landing of sharks by month was $2,087.6 \mathrm{~kg}$ in June while the highest landing of rays was in March with $1,097.4 \mathrm{~kg}$. Landings of skates was only 8.0 kg in January 2016 (Table 6).

### 2.1.3 Sharks, Rays and Skates Composition

A total of $769,460.9 \mathrm{~kg}$ of fish was landed from 168 landings during the study period at Cilacap. Rays and sharks made up $44,993.5 \mathrm{~kg}(6 \%)$ and $184,539 \mathrm{~kg}(24 \%)$ from the total landing respectively. While landings of bony fishes were $539,295.4 \mathrm{~kg}(70 \%)$ and there is no catch of low value fish. Average landings per month for sharks and rays were $15,378.25 \mathrm{~kg}$ and $3,749.5 \mathrm{~kg}$, respectively. The highest landing by month for rays was $12,822 \mathrm{~kg}$ in October (2015), followed by $11,965 \mathrm{~kg}$ in September (2015) and $5,680 \mathrm{~kg}$ in August (2015). However, the highest landing for sharks was $26,798 \mathrm{~kg}$ in September (2015) followed by $22,114 \mathrm{~kg}$ in August (2015) and 21,623 kg in May (2016). In general, the landing of sharks and rays ranged between $10-100 \%$ and $0-20 \%$ respectively from total landings at Cilacap. The catch composition of sharks and rays landed at Cilacap are shown in Table 7.

Table 7: Catch Composition of Sharks, Rays and Bony Fish by Month from 168 Landings at Cilacap. All Weights in Kilogram.

| Yearl <br> Month | Weight <br> of ray | \% <br> Ray | Weight of <br> shark | \% <br> Shark | Weight of <br> Bony fish | \% <br> Bony <br> fish | Total |

A total of $180,817.86 \mathrm{~kg}$ of fish was landed from 107 landings during the study period at Lampulo. Sharks, rays and skates made up $12,757.3 \mathrm{~kg}, 3,379.3 \mathrm{~kg}$, and $8.0 \mathrm{~kg}(7.1 \%, 1.9 \%$, and $0.004 \%$ ) from the total landing respectively. While landings of bony fishes were $164,690 \mathrm{~kg}$ ( $91.1 \%$ ) and there is no catch of low value fish. Average landings per month for sharks and rays were 1063.11 kg and 307.21 kg respectively. The highest landing by month for rays was $1,097.4$ kg in March (2016), followed by 964.0 kg in November (2015) and 345.4 kg in October (2015).

The highest landing for sharks was $2,087.6 \mathrm{~kg}$ in June (2016) followed by $1,989.7 \mathrm{~kg}$ in September (2015) and 1,797.6 kg in December (2015). In general, landing of sharks and rays ranged between $3.7-49.3 \%$ and $0-43 \%$ respectively from total landings at Lampulo. However, only 8.0 kg ( $0.004 \%$ ) of skate was landed only in January (2016). The details are shown in Table 8.

### 2.1.4 Sample Size

A total of 2,899 individuals belonging to 435 rays and 2,464 sharks were sampled comprising four species of rays and 15 species of sharks. The most abundant ray species were Mobula japanica. The highest number of rays sampled by month was 110 individual in September (2015) followed by 79 individual in October (2015) and 77 individual in February (2016). The most abundant shark species were Alopias superciliosus followed by A. pelagicus and Prionace glauca. However, the highest number of sharks sampled by month was 290 individuals in November (2015), followed by 270 individuals in May (2016) and 285 individuals in April (2016). All these species were landed throughout the year. The details are as shown in Table 9.

A total of 641 individuals belonging to 214 rays, 425 sharks, and two skates were sampled comprising 24 species of rays, 25 species of sharks, and two species of skates. The most abundant ray species were Neotrygon orientalis followed by Pateobatis jenkinsii and Rhynchobatus australiae. The highest number of rays sampled by month was 43 individuals in March (2016) and November (2015)followed by 28 individuals in January (2016) and 20 individuals in October and December (2015). The highest number of sharks sampled by month was 53 individual in June (2016) followed by 51 individuals in September (2015) and 47 individuals in December (2015). The most abundant shark species were Alopias pelagicus followed by Carcharhinus amblyrhynchos and Centrophorus moluccensis. Alopias pelagicus was landed throughout the year. The details are as shown in Table 10.

### 2.1.5 Weight of Sharks and Rays by Species

A total of $231,197 \mathrm{~kg}$ of sharks and rays was landed at Cilacap from 168 landings comprising $43,876 \mathrm{~kg}$ rays and $187,321 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was Mobula japanica amounting to $36,789.5 \mathrm{~kg}$, followed by $3,500.5 \mathrm{~kg}$ Mobula thurstoni and $3,280 \mathrm{~kg}$ Mobula tarapacana. The highest landing by month was $11,104 \mathrm{~kg}$ for Mobula japanica in October, followed by $8,760 \mathrm{~kg}$ in September and $4,895 \mathrm{~kg}$ in August (2015). Landings of Mobula tarapacana and M. thurstoni only fove and four months respectively. The highest landings of shark by species was $52,941 \mathrm{~kg}$ for Alopias superciliosus followed by $46,778 \mathrm{~kg}$ for Alopias pelagicus and $17,932 \mathrm{~kg}$ for Prionace glauca. The highest landing by month for Alopias pelagicus was $11,753 \mathrm{~kg}$ in August (2015) followed by Alopias superciliosus ( $10,394 \mathrm{~kg}$ ) in May (2016) and Prionace glauca ( $5,218 \mathrm{~kg}$ ) in November (2016). The details of are shown in Table 11 and Table 12.
Table 11: Weight of Sharks Landings by Species at Cilacap

| Species of sharks | 2015 |  |  |  |  | 2016 |  |  |  |  |  |  | Total |

A total of $15,761.36 \mathrm{~kg}$ elasmobranchs was landed at Lampulo from 107 landings comprising $12,383.14 \mathrm{~kg}$ of sharks, $3,370.22 \mathrm{~kg}$ of rays and 8.0 kg of skates. For rays, the highest landings by weight was Pateobatis jenkinsii (1,502.9 kg), followed by Neotrygon orientalis ( 523.28 kg ) and Rhynchobatus australiae ( 405.6 kg ). The highest landings by month was Pateobatis jenkinsii (666.7 kg) in March (2016), followed by Neotrygon orientalis (256 kg) in November (2015) and Rhynchobatus australiae ( 111.8 kg ) in October (2015). The highest landing of shark was Alopias pelagicus $(4,167 \mathrm{~kg})$ followed by Galeocerdo cuvier ( $1,632 \mathrm{~kg}$ ) and Centrophorus moluccensis $(1,231 \mathrm{~kg})$. The highest landing by month was Centrophorus moluccensis ( $877,3 \mathrm{~kg}$ ) in June followed by Alopias pelagicus ( 770 kg ) in October and Galeocerdo cuvier ( 693 kg ) in December. The details are shown in Table 13 and Table 14

### 2.1.6 Size Range of Sharks and Rays

In general most rays species sampled from August 2015 to July 2016 were immature. The average size of Mobula japanica, and Mobula thurstoni ranged between 165-206.5 cm, 153.5-184.5 cm disc length, respectively. However, most sharks species landed were mature. These included Alopias pelagicus, Alopias superciliosus, Isurus oxyrhynchus, Isurus paucus, Prionace glauca and Sphyrna lewini. The average ranged size (Total Length) between 268.5-279.5 cm, 224.3-285.5 $\mathrm{cm}, 199.0-80.0 \mathrm{~cm}, 185-235.0 \mathrm{~cm}, 198.2-256.0 \mathrm{~cm}$ and 201.8-305.0 cm total length, respectively. Alopias pelagicus from the Indian Ocean can reach the maximum length of 365 cm . Males reach adult at size about $240-250 \mathrm{~cm}$ and females at 260-285 cm (White et.al., 2006; White, 2007). Liu et al. (1999) reported that the total length at maturity was 282-292 cm for females and $267-276 \mathrm{~cm}$ for males. Based on the results of the study, it can be said that most of Alopias pelagicus caught from the Indian Ocean in the years 2002-2007 are commonly at adult stage (mature non reproductive or mature sexually) (Dharmadi et al., 2012). Size ranged of all sharks and rays species landed at Cilacap from August to May are shown in Table 15A and Table 15B.

Only Neotrygon orientalis was mature with average size ranged between $23-30 \mathrm{~cm}$ disc length. Pateobatis jenkinsii was immature. The matured sharks s were Alopias pelagicus, Galeocedo cuvier, and Sphyrna lewini with average size(TL) ranged between 249-276 cm, 168$298 \mathrm{~cm}, 171-267 \mathrm{~cm}$ respectively. The details are shown in Table 16A and Table 16B.
Measurement for Rhinobatos penggali is TL, Alopias pelagicus from Jan-July and A. superciliosus from Feb-July in 2016 is PCL.

| Total | 63 | 63 | 98 | 57 | 35 | 41 | 26 | 30 | 23 | 30 | 67 | 37 | 570 |

The highest CPUE of sharks landed at Cilacap were $32.86 \mathrm{~kg} / \mathrm{day}$ for Alopias pelagicus followed by $29.04 \mathrm{~kg} /$ day for Alopias superciliosus and $11.13 \mathrm{~kg} / \mathrm{day}$ for Isurus oxyrinchus. For ray, the highest CPUE was $22.84 \mathrm{~kg} /$ day for Mobula japanica, followed by M. thurstoni at $2.17 \mathrm{~kg} / \mathrm{day}$ and Mobula tarapacana at $2.04 \mathrm{~kg} /$ day (Table 20).

While the highest CPUE of sharks landed at Lampulo was $18.21 \mathrm{~kg} /$ day for Alopias pelagicus, followed by $7.12 \mathrm{~kg} /$ day Galeocerdo cuvier and $5.38 \mathrm{~kg} /$ day Centrophorus moluccensis. The highest CPUE of rays was 6.56 kg/day for Pateobatis jenkinsii, and followed by Neotrygon orientalis at $2.29 \mathrm{~kg} / \mathrm{day}$ and Rhynchobatus australiae at $1.77 \mathrm{~kg} / \mathrm{day}$ (Table 21).

| Himantura uarnak | 40.0 | 0.17 |

### 2.1.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally and some were exported to China, Hong Kong, Bangladesh, and Sri Lanka. The major markets were wholesale markets in Cilacap and Banda Aceh. The price varied according to species. Market destinations for sharks and rays were similar in local market. The price was almost consistent for the whole year for all species. All sharks and rays were landed whole with fins. The details price of shark and ray at Cilacap are shown in Table 22 and Table 23.

The most expensive sharks at Cilacap were Carcharhinus plumbeus, Carcharhinus leucas, and Carcharhinus brevipinna sold at IDR $23,000 / \mathrm{kg}$, followed by Carcharhinus sorrah and Carcharhinus falciformis at IDR16,000/kg, and Sphyrna lewini and Isurus spp. at IDR14,000/kg. The price for Mobula spp. was IDR80,000/kg.

The most expensive sharks (big size) at Lampulo were Carcharhinus leucas, and Sphyrna lewini sold at IDR $30,000 / \mathrm{kg}$, followed by Carcharhinus falciformis at IDR $28,000 / \mathrm{kg}$. Price for Carcharhinus amblyrhynchos and C. albimarginatus at IDR 25,000/kg. The price for medium and small sizes, the highest price were for Sphyrna lewini and C. leucas at IDR 25,000/kg and IDR $20,000 / \mathrm{kg}$, respectively. The most expensive ray at Lampulo was Rhynchobatus australiae at IDR $35,000 / \mathrm{kg}$ for big size, IDR $30,000 / \mathrm{kg}$ for medium size and IDR $25,000 / \mathrm{kg}$ for small size.

Table 22: Price of Sharks and Rays by Species at Cilacap Landing Site in 2016. All Prices in IDR per Kilogram. (Exchange rate: IDR 13,500= US\$ 1.00).

| Location | Species | Range price <br> (Rp/kg) | Part | Market <br> destination |
| :--- | :--- | :---: | :--- | :--- |
| CILACAP | Sharks |  |  |  |
|  | Alopias spp | $8,000-14,000$ | Whole | Local |
|  | Isurus spp | 14,000 | Whole | Local |
|  | Sphyrna lewini | 14,000 | Whole | Local |

|  | Rhynchobatus australiae | 25,000 | 30,000 | 35,000 | Whole | Local |

### 3.0 CONCLUSION

A total of 32 species of sharks belonging of 12 families, and 29 spesies of rays belonging of 12 families were recorded at two landing sites. The most abundant sharks species at Cilacap were Alopias superciliosus followed by Alopias pelagicus and Prionace glauca, while the dominant rays were Mobula japanica followed by Mobula thurstoni and Mobula tarapacana. The most abundant sharks species landed at Lampulo were Alopias pelagicus followed by Galeocerdo cuvier and Centrophorus moluccensis, while the dominant rays were Pateobatis jenkinsii followed by Neotrygon orientalis and Rhynchobatus australiae. The list of sharks and rays species are shown in Appendix I.

The fishes landed at Cilacap consist of rays and sharks made up 6\% and $24 \%$ from the total landing respectively, and for commercial species were $70 \%$. The main gear landing sharks and rays at Cilacap was the longline comprising sharks (64.2 \%) and rays ( $0.2 \%$ ). In general, the landing of sharks and rays ranged between $10-100 \%$ and $0-20 \%$ respectively. The fishes was landed at Lampulo consist of rays and sharks made up $1.9 \%$ and $7.1 \%$ from the total landing respectively, and $91.1 \%$ for other commercial fish. In general, the landing of sharks and rays ranged between 3.7-49.3 \% and 0-43\% respectively.

Atotal of $229,352.5 \mathrm{~kg}$ of sharks and rays was landed at Cilacap from 168 landings comprising $184,539 \mathrm{~kg}$ sharks and $44,993.5 \mathrm{~kg}$ rays. The highest landing by weight from ray species were Mobula japanica ( $36,789.5 \mathrm{~kg}$ ), followed by $3,500.5 \mathrm{~kg}$ Mobula thurstoni and $3,280 \mathrm{~kg} \mathrm{Mobula}$ tarapacana. The highest landing by month was $11,104 \mathrm{~kg}$ for Mobula japanica in October, followed by $8,760 \mathrm{~kg}$ in September and $4,895 \mathrm{~kg}$ in August 2015. The highest landing of shark species were $52,941 \mathrm{~kg}$ for Alopias supercliosus followed by $46,778 \mathrm{~kg}$ for Alopias pelagicus and $17,932 \mathrm{~kg}$ for Prionace glauca. The highest landing by month for Alopias pelagicus was $11,753 \mathrm{~kg}$ in August (2015) followed by $10,394 \mathrm{~kg}$ Alopias superciliosus in May (2016) and 5,218 kg in November (2015) for Prionace glauca.

A total of $15,761.4 \mathrm{~kg}$ was landed at Lampulo from 107 landings comprising $3,378 \mathrm{~kg}$ rays and $12,383.1 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was from species Pateobatis jenkinsii amounting to $1,503 \mathrm{~kg}$, followed by 523.3 kg Neotrygon orientalis and 405.6 kg for Rhynchobatus australiae. The highest landing by month was 667 kg for Pateobatis jenkinsii in March, followed by 256 kg Neotrygon orientalis in November and 112 kg Rhynchobatus australiae in October (2015). The highest landing of shark species were $4,167 \mathrm{~kg}$ for Alopias pelagicus followed by $1,632 \mathrm{~kg}$ for Galeocerdo cuvier and $1,231 \mathrm{~kg}$ for Centrophorus moluccensis. The highest landing by month for Centrophorus moluccensis was 877 kg in June (2015) followed by Alopias pelagicus at 770 kg in October (2015) and Galeocerdo cuvier at 693 kg in December (2015). The ray species Neotrygon orientalis and Rhynchobatus australiae landed at Lampulo from August (2015) to May (2016) were mature with average size between 28.2-41.4 cm and 121.8-133.2 cm disc length, respectively. The shark species Alopias pelagicus, Galeocedo cuvier, and Sphyrna lewini were mature with average size between $257-262 \mathrm{~cm}, 276-279 \mathrm{~cm}$ and 241-255 cm total length, respectively.

The catch of sharks fluctuated but the peak season occurred in June (2016) at Lampulo and September (2015) at Cilacap. Most sharks species caught were adult such as Alopias pelagicus, A.superciliosus, Isurus oxyrhinchus, I. paucus, Prionace glauca, Galeocerdo cuvier and Sphyrna lewini.

### 4.0 OUTPUT AND OUTCOME

The project outputs and outcomes are summarised in Table 24. as shown below.
Table 24: Output and Outcome

| No | Output | Outcome |
| :--- | :--- | :--- |
| 1. | Four trained personnel in sharks and rays <br> taxonomy from the Ministry of Fisheries <br> Indonesia. | Trained staffs are now able to make the <br> right and valid identification of species. <br> Training materials stored electronically <br> and easy to excess. |
| 2. | A standardised format for data collection for <br> national activity produced. | Improved technique of data collection <br> for implementation at national level |
| 3. | Detailed information on the percentages of <br> sharks and rays from the total landing at pilot <br> project sites. | Confirmed earlier data published in <br> Indonesia National Statistics. Sharks <br> and rays were targeted and bycatch and <br> contributed to only about 2 \% of total <br> marine landing. |
| 4. | Information on relative dominance of the <br> different species of sharks and rays obtained. | Increased awareness of needs and <br> measures for shark conservation and <br> management on specific species. |
| 5. | Information on the monthly fluctuation of the <br> different species of sharks and rays obtained. | Trends of landings by species analysed <br> for national level management. |
| 6. | Stage of maturity for the different species of <br> sharks and rays determined. | Increased awareness of needs and <br> measures for shark conservation and <br> management among stakeholders |
| 7. | Information on usage and marketing of the <br> landed sharks and rays were obtained from <br> the pilot project. | Confirmed earlier report in current <br> NPOA-Sharks that all sharks and rays <br> are landed whole, fully utilised with no <br> finning activities onboard vessels. |
| 8. | A report on landing of sharks and rays up to <br> species level from three sites in Perak. | Data recording on sharks and rays will <br> be improved from generic terms 'sharks' <br> and 'rays' to species level. |
| 9. | Issues and problems arising from this activity <br> identified and improvements made especially <br> with the data collection format | Development of a comprehensive <br> national data collection system for <br> sharks and rays as part of the National <br> Plan of Action Sharks |
| 10. | Specimens collected during sampling activities <br> deposited for future reference. | A specimen laboratory for <br> elasmobranchs has been established <br> at the wet Laboratory at Cilacap and <br> Lampulo. |

### 5.0 FUTURE ACTIVITIES

Indonesia will continue to record landing data up to species level at an additional some fish landing sites in 2017. Data collection at the current three landing sites is to be continued. Awareness programme will be continued in other parts of the country. All activities are shown in Appendix II.

### 1.0 INTRODUCTION

Malaysia is a home to a rich diversity of sharks, rays, skates and chimaeras (Class Chondrichthyes). However, sharks and rays landings contribute only about $1 \%$ and $2 \%$ of total marine landings respectively. Until 2016, Malaysia recorded 162 species of Chondrichthyans comprising 70 sharks, 85 rays, six skates and one chimaera, belonging to 18 families of sharks, 12 rays, two skates and one chimaera. The high diversity of sharks was recorded from the Order Carcharhiniformes with 50 species and Orectolobiformes with 10 species. However, low diversity was recorded for the Orders Hexanchiformes with three species, and Lamniformes and Squatiniformes with two species respectively. Species diversity in the Order Heterodontiformes was scanty where only one species was recorded. As for batoids, high diversity was recorded for the Order Myliobatiformes with 62 species followed by Torpediniformes with 12 species and Rhinobatiformes with eight species. Only six species were recorded from the Order Rajiformes and three species from Pristiformes. Even though the number of chondrichthyans species recorded in Malaysia was more than 160, the actual status of its biodiversity is still unknown. With new species continuously discovered, the number is expected to increase in the future. At present the deep water species are mostly unknown due to limited research activities. Most sharks and rays species landed especially from the Families Carcharhinidae and Dasyatidae and are very difficult to identify up to species level by untrained and inexperienced enumerators. Only well trained staff will be able to make the right and valid identification of species (Ahmad and Annie Lim, 2012).

### 1.1 Objective

The objectives of this project were:

- to enhance human resource development in elasmobranch taxonomy, and
- to improve landing data recording from generic 'sharks' and 'rays' to species level.

### 1.2 Data Collection at Landing Sites

### 1.2.1 Selection of Study Sites

The State of Perak on the west coast of Peninsular Malaysia is a major landing state for sharks and rays. Two districts facing the Straits of Malacca, namely Larut Matang and Selama, and Manjung Utara were selected as the study sites as they were the main landing sites of sharks and rays in the state. The landing data were collected at 13 jetties i.e 10 in Larut Matang and Selama and three in Manjung Utara. The landing sites are private enterprises with most of the sharks and rays landing coming from trawlers. The location of all landing sites are shown in Figure 1.

Figure 1: Location of Study Sites in the State of Perak
Sabah, with the population of 3.544 million ( 2015 census) is the second largest state in Malaysia, nicknamed 'Negeri Di Bawah Bayu' or Land Below The Wind and occupying the northern part of Borneo. The total land area of Sabah is about 73,631 square kilometres and famed for its 4,095 meter-tall Mt. Kinabalu, the highest peak in the country, as well as for its ethnic diversity, serene beaches, virgin rainforest, coral reefs and abundant flora and fauna species. Surrounded by South China Sea in the west, Sulu Sea in the northeast and Celebes (Sulawesi) Sea in the northeast, Sabah is indeed blessed with its marine resources, In 2015, the landing of marine fish in the state was 175,443 metric tonnes ( mt ) with the value of RM902.5 million. Sabah maintained its status as a net exporter of fisheries commodities, amounting 74,973 metric tonnes with the value of RM851.7 million in 2014.

There are 16 coastal districts in Sabah and for the purpose of this project, Sandakan in the east and Kota Kinabalu in the west, were selected as the study sites, due to the fact that both districts are major fisheries landing points in Sabah (Figure 2)

Figure 2: Location of Study Sites in the State of Sabah

### 1.2.2 Fishery Structure and Background of Study Sites

### 1.2.2.1 Larut Matang

Larut Matang is one of the major landing sites for sharks and rays in Perak. All jetties belong to private enterprises. The major gears were trawl nets (583), followed by drift nets (144) and purse seine (29). All trawlers are normally operated by 4-5 crew members. Almost all of the sharks and rays were landed by trawlers operating beyond eight nautical miles from the coastline. Fishing operation normally between 5-12 days per trip. All catches were landed from 0500hr - 1000hr. The details of fishing vessels registered in this district are shown in Table 1.

Table 1: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Larut Matang

| Type of Gear | Fishing <br> Zone | Fishing operation <br> (from coastline) | No. of <br> Vessels | No. of <br> Fishers |
| :--- | :---: | :---: | ---: | ---: |
| Trawlers |  |  |  |  |
| $10-24.9$ GRT | B | $>8 \mathrm{~nm}$ | 380 | 760 |
| $25-39.9$ GRT | B | $>8 \mathrm{~nm}$ | 20 | 26 |
| $39.9-69.9$ GRT | C | $>12 \mathrm{~nm}$ | 174 | 306 |
| $>70$ GRT | C 2 | $>15 \mathrm{~nm}$ | 9 | 36 |
| Total |  |  | $\mathbf{5 8 3}$ | $\mathbf{1 , 1 2 8}$ |
| Purse Seiners | C 2 |  | 29 nm | $\mathbf{2 9}$ |

### 1.2.2.2 Manjung Utara

All jetties in Manjung Utara belong to private enterprises. The major gears were drift nets (560), followed by trawl nets (242) and purse seine (16). Other gears were longline (10) and handline (5). The details of the fishing vessels registered in this district are shown in Table 2. The major gears landing sharks and rays were trawl nets, gill nets and longlines. All trawlers are normally operated by 4-5 crew members. However, the number of crew for traditional gears such as gillnets and longlines was normally 2-3 fishers. The fishing operation for trawlers was normally between 5-12 days per trip while longlines and gill nets were normally a daily trip. All catches were landed from 0730hr - 1200hr.

Table 2: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Manjung Utara

| Type of Gear | Fishing Zone | Fishing operation (from coastline) | No. of Vessels | No. of Fishers |
| :---: | :---: | :---: | :---: | :---: |
| Trawlers |  |  |  |  |
| 10-24.9 GRT | B | $>8 \mathrm{~nm}$ | 217 | 434 |
| 25-39.9 GRT | B | $>8 \mathrm{~nm}$ | 1 | 4 |
| 39.9-69.9 GRT | C | > 12 nm | 23 | 92 |
| > 70 GRT | C2 | > 15 nm | 1 | 7 |
| Total |  |  | 242 | 537 |
| Purse Seiners |  |  |  |  |
| 40-69.9 GRT | C | > 12 nm | 3 | 83 |
| > 70 GRT | C2 | $>15 \mathrm{~nm}$ | 13 | 312 |
| Total |  |  | 16 | 395 |
| Drift Netters | A | All Areas | 560 | 1,103 |
| Longliners | A | All Areas | 10 | 20 |
| Handliners | A | All Areas | 5 | 5 |
| Others | A | All Areas | 20 | 20 |
| Total |  |  | 595 | 1,148 |
| Grand Total |  |  | 853 | 2,080 |

### 1.2.2.3 Kota Kinabalu

Sabah Fisheries Marketing Authority (SAFMA) Jetty is the biggest fish landing jetty in Kota Kinabalu district. Commercial fishing vessels mainly operating trawl nets and purse seines landed their catch here on a daily basis. There are estimated around 30 fishing vessels utilizing the jetty during a particular period of landing time allowed, which is from 12 midnight untill noon the next day.

There are 224 trawlers in Kota Kinabalu compare to purse seines which are only around 41. The operation duration per trip of trawl nets is up to a week while the purse seine's operations only take up to three days the most. The details of commercial fishing vessels in Kota Kinabalu are shown in Table 3.

Table 3: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Kota Kinabalu

| Type of Gear | Fishing <br> Zone | Fishing Operation <br> (from coastline) (Nautical Mile) | No. of <br> Vessels | No. of Fishers |
| :--- | :---: | :---: | :---: | :---: |
| Trawlers | West Coast | $>3 \mathrm{~nm}$ | 9 | 27 |
| $<10$ GRT | $>3 \mathrm{~nm}$ | 51 | 180 |  |

| $>70$ GRT |  |  | $\mathbf{2 6 5}$ | $\mathbf{1 , 4 8 9}$ |
| Total |  |  |  | 584 |
| Grand Total |  |  |  |  |

### 1.2.2.4 Sandakan

Sandakan was the first capital city of Sabah and used to be dubbed as 'Little Hong Kong' due to the booming commercial port activities back then. Sandakan has the highest number of trawl net vessels is Sabah, which is around 457 compare to 1,069 total of trawl net vessels state wide. In a big contrast, there are only twelve purse seines vessels operating in Sandakan waters. Sandakan is ranked third in marine fish landing in 2015 with $18,700 \mathrm{mt}$, behind Kota Kinabalu ( $61,800 \mathrm{mt}$ ) and Kudat $(24,600 \mathrm{mt})$. The total landing of the state during that year was $175,400 \mathrm{mt}$. There are a number of fish landing jetties in Sandakan but the main landing point in the district is the Sandakan Fish Market Jetty where 45 estimated fishing vessels of various sizes landed their catch daily. The details of commercial fishing vessels in Sandakan are shown in Table 4.

Table 4: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Sandakan

| Type of Gear | Fishing Zone | Fishing Operation (from coastline) (Nautical Mile) | No. of Vessels | No. of Fishers |
| :---: | :---: | :---: | :---: | :---: |

### 1.3 Appointment of Enumerators

Two Assistant Fisheries Officers from the State Fisheries Office of Perak and two Assistant Fisheries Officers from the Department of Fisheries Sabah were appointed as enumerators for each district or study site. Their names and addresses are as follows:

| Study site 1: Larut Matang and Selama, Perak |
| :--- |
| Mr. Abdul Rahman bin Haji Ali Hasan |
| Pejabat Perikanan Daerah Taiping |
| Tingkat 6, Wisma Persekutuan, Jalan Istana Larut |
| 34000 Taiping, Perak. |
| Tel: +6 058075311 |
| Email: abd.rahman0865@gmail.com |
| Study site 2: Manjung Utara, Perak |
| Mr. Mahazir bin Baharom <br> Pejabat Perikanan Daerah Manjung Utara <br> Jalan Damar Laut <br> 34900 Pantai Remis <br> Perak Darul Ridzuan <br> Tel: +6 056772224 <br> Email:Mahazirbaharom@yahoo.com <br> Study site 3: Kota Kinabalu, Sabah <br> Mr. Justin Agon <br> Senior Assistant Fisheries Officer <br> Department of Fisheries Sabah <br> Jalan Haji Saman <br> 88000 Kota Kinabalu <br> Sabah, MALAYSIA. <br> Tel No. : +6 088 262359 <br> Email : Justin.agon@sabah.gov.my <br> Mr. Norhairul Bin Nordin <br> Assistant Fisheries Officer <br> Department of Fisheries Sabah <br> Wisma Pertanian Sabah, <br> Jalan Tasik Luyang (Off Jalan Maktab Gaya) <br> 88624, Kota Kinabalu <br> Sabah, MALAYSIA. <br> Tel No. : +6 088 235966 <br> Email: Hairul_elut@yahoo.com |

```
Mr. Chin En Kiong
Senior Assistant Fisheries Officer
Department of Fsiheries Sabah
P.O. BOX 1369,
90715, Sandakan,
Sabah, MALAYSIA
Tel No. : +6 089 208870
Email : EnKiong.Chin@sabah.gov.my
Mr. Maurice @ Kassim bin Anchi
Senior Assistant Fisheries Officer
Department of Fisheries Sabah
P.O. BOX 1369,
90715, Sandakan,
Sabah, MALAYSIA
Tel No. : +6 089 208870
Email : Maurice.anchi@sabah.gov.my
National Coordinator and Project Coordinator for Perak
Mr. Abd Haris Hilmi bin Ahmad Arshad
Senior Researcher
Fisheries Research Institute, Capture Fisheries Division
Kompleks Perikanan Kampung Acheh, Department of Fisheries Malaysia
32000 Sitiawan Perak, MALAYSIA
Tel: +6 056914752
Email:haris_hilmi@dof.gov.my
Project Coordinator for the Sabah
Mr. Lawrence Kissol
Assistant Director (Marine Resource Management)
Department of Fisheries Sabah
Wisma Pertanian Sabah, Jalan Tasik Luyang (Off Jalan Maktab Gaya)
88624, Kota Kinabalu,
Sabah, MALAYSIA.
Tel No. : +6 088 235966
Email : Lawrence.kissol@sabah.gov.my
```

### 1.4 Materials and Methods

### 1.4.1 Sampling Methods

The sampling activity started in August 2015 until July 2016. All enumerators were requested to record landing data and other related information in a standard form at least 12 days per month. A Standard Operating Procedure entitled 'SOP Sharks, Rays and Skates Data Collection in the Southeast Asian Waters' was used as a guide. The content included Standard Operation Procedure and instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of enumerator, name of landing site, date of sampling, vessel registration number, vessel GRT, fishing area, price at landing sites, name of species (common name and scientific name), total catch of sharks, rays, commercial and low-value species from each sampling vessel. The completed data in excell were then submitted to the respective National Coordinator before submitted to SEAFDEC/MFRDMD before second week of the following month for verification. The data were analysed at the end of each quarter.

### 1.4.2 Selection of Fishing Vessels and Sampling Activities

Between 1-3 fishing vessels were selected for sampling each day for 12 days per month at each landing site. Measurement of Total length (TL) were taken for all skates, sharks and rays species from the Families Rhynchobatidae, Rhinobatidae and Narcinidae. While Disc Length (DL) were taken for all ray species where the tail is frequently absent or damaged (mainly from the Families Dasyatidae, Gymnuridae and Mobulidae). All sharks and rays specimens were measured and weighed individually if the total number was less than 50 tails per vessel. If the total number was more than 50 tails, only $10-50 \%$ were measured. The maturity stage for each individual was estimated according to Yano et al. (2005) and Ahmad and Annie Lim (2012). The total catch of all sharks and rays by species as well as the total catch of commercial and low-value species were also recorded for each sampling vessel. Some samples were brought back to the Fisheries Research Institute, Capture Fisheries Division, Kg. Acheh Sitiawan Perak and Fisheries Research Center, Likas Kota Kinabalu for preservation and future references. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3 Classification

The classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ahmad et al. (2013) and Ahmad et al. (2014), Ebert et al. (2013) and Last et al. (2016).

### 2.0 RESULTS

### 2.1 Larut Matang

### 2.1.1 Landing Samples

A total of 336 landings were sampled during the study period. The highest by month was 33 in October followed by 29 in December 2015. The highest by gear type was 263 Zone C trawl net followed by 39 of longline, 14 of Zone C2 and 13 of Zone B trawl net. The details are shown in Table 5.

### 2.1.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks at Larut Matang was trawl net at $5,344.7 \mathrm{~kg}(67.0 \%)$ followed by purse seine and drift net at very small amount ( $22 \mathrm{~kg} \mathrm{)} \mathrm{while} \mathrm{longline}$, nautical miles from the coastline landed the highest rays at $2,077 \mathrm{~kg}(26.0 \%)$ followed by drift net at $314 \mathrm{~kg}(3.9 \%)$ and trawl net at $219 \mathrm{~kg}(2.7 \%)$. Most trawlers operated beyond eight nautical miles from the coastline. Zone C trawl net landed the highest at $4,912 \mathrm{~kg}$ followed by Zone C 2 trawl net $(399 \mathrm{~kg})$ and Zone $B$ at 33 kg . The highest landing of rays by month was from longline at 499.6 kg in December 2015, while in April and July 2016 were 425.5 kg and 261.9 kg respectively. The highest landing of sharks by month came from Zone C trawl net in August 2015 at 600.4 kg followed by 542.2 kg in October 2015 and 501 kg in May 2016. The details are shown in Table 6.

### 2.1.3 Sharks and Rays Composition

A total of $1,578,271 \mathrm{~kg}$ of fish was landed from 336 landings during the study period. Rays and sharks made up $24,570 \mathrm{~kg}$ and $5,439 \mathrm{~kg}(1.4 \%$ and $0.4 \%)$ from the total landing respectively. Landings of bony fish was $1,548,281.8 \mathrm{~kg}$ or $98.2 \%$. Average landings per month for sharks and rays were 453 kg and $2,048 \mathrm{~kg}$ respectively. The highest landing by month for rays was $8,790 \mathrm{~kg}$ in July, followed by $3,229 \mathrm{~kg}$ in May and $2,905 \mathrm{~kg}$ in June 2016. However, the highest landing for sharks was 807 kg in August 2015 followed by 572 kg in October 2015 and 530 kg in May 2016. In general, the landing of sharks and rays ranged between $0.2-0.8 \%$ and $0.7-4.7 \%$ respectively from total landing. The details are shown in Table 7.

### 2.1.4 Sample Size

A total of 8,039 tails belonging to 4,873 rays and 3,166 sharks were sampled comprising 19 species of rays and 14 species of sharks during the study period. The most common and abundant rays species were Neotrygon orientalis, Maculabatis gerrardi, Brevitrygon heterura and Telatrygon biasa. Other common rays species were Rhynchobatus australiae, Maculabatis pastinacoides and Hemitrygon akajei. All these species were landed throughout the year. Other rays species such as Dasyatis thetidis, Urogymnus granulatus, Rhinobatos cf. borneensis, Rhynchobatus laevis, were only landed between 1-3 months. The highest number of rays sampled by month was 474 tails in August followed by 455 tails in September 2015 and 446 tails in January 2016.

The most common and abundant sharks species recording in 12 months were Chiloscyllium hasseltii, C. punctatum and Atelomycterus marmoratus. Other common sharks species were Atelomycterus cf. ermanni and Carcharhinus sorrah. These species were landed between 10-12 months. Other sharks species such as Carcharhinus brevipinna, C. limbatus, C. leucas and Galeocerdo cuvier were only landed between 1-2 months. The highest number of sharks sampled by month was 324 tails in May, followed by 323 tails in January 2016 and 303 tails in August 2015. The details are as shown in Table 8.
Table 8: Sample Size of Sharks and Rays by Species

### 2.1.5 Weight of Sharks and Rays by Species

A total of $23,702 \mathrm{~kg}$ was landed from 336 landings comprising $18,351 \mathrm{~kg}$ of rays and $5,352 \mathrm{~kg}$ of sharks. For rays, the highest landing by weight was Maculabatis gerrardi amounting to $7,021 \mathrm{~kg}$, followed by $5,053 \mathrm{~kg}$ of Neotrygon orientalis and $1,938 \mathrm{~kg}$ of Pateobatis fai. The highest landing by month for Maculabatis gerrardi was $1,465 \mathrm{~kg}$ in July 2016, followed by 891 kg in December 2015 and 802 kg in Jun 2016. For Neotrygon orientalis, the highest landing was 863 kg in May, followed by 814 kg in July and 674 kg in June 2016. For Pateobatis fai, the highest landing was $1,700 \mathrm{~kg}$ in May followed by 238 kg in June 2016. Other important species based on high landing were Pateobatis jenkinsii ( 992 kg ), Brevitrygon heterura ( 994 kg ), Maculabatis pastinacoides ( 688 kg ), Telatrygon biasa ( 683 kg ), Rhynchobatus australiae ( 408 kg ) and Hemitrygon akajei at 341 kg . Landing of other species was below 100 kg .

The highest landing of shark species was $2,433 \mathrm{~kg}$ for Chiloscyllium hasseltii followed by 1,835 kg for Chiloscyllium punctatum, 541 kg for Carcharhinus sorrah and 343 kg for Atelomycterus marmoratus. The highest landing by month for Chiloscyllium hasseltii was 329 kg in August 2015 followed by 275 kg in January 2016 and 268 kg in October 2015. For Chiloscyllium punctatum, the highest landing was 306 kg in August followed by 211 kg in October and 204 kg in September 2015. Landing of other species was below 100 kg . The details are shown in Table 9.
Table 9: Weight of Sharks and Rays (in Kg ) by Species from 336 Landings at Larut Matang

### 2.1.6 Size Range of Sharks and Rays

In general from August 2015 to January 2016, both mature and immature rays species were sampled. Generally, rays species sampled were mature except for Maculabatis gerrardi, Maculabatis cf. gerrardi, Pateobatis jenkinsii, Rhynchobatus australiae and $R$. laevis. The average size of Maculabatis gerrardi ranged between 33.1-39.9 cm disc length. Most adult sized of Maculabatis gerrardi were immediately removed by middlemen upon being landed. First maturing size for Maculabatis gerrardi is about 59.0 cm (disc width). Male of Rhynchobatus australiae mature at 130 cm total length and female mature at 155 cm . However, almost all samples of Telatrygon biasa, Neotrygon orientalis and Rhinobatos cf. borneensis were mature. Size range of rays species from August 2015 to January 2016 are shown in Table 10A (i). Ray species sampled from February to July 2016 were mature except for Maculabatis gerrardi, Pateobatis jenkinsii and Rhynchobatus australiae. Almost all specimens of Telatrygon biasa, Neotrygon orientalis and Brevitrygon heterura were matured. Size range of rays sampled from February to July 2016 are shown in Table 10A (ii).

Most of shark species sampled between August 2015 to January 2016 were mature except for Carcharhinus brevipinna, C. leucas, C. limbatus, C. sorrah and Galeocerdo cuvier. Mature size for female of $C$. brevipinna is ranged between $170-220 \mathrm{~cm}$ total length and for male between $159-203 \mathrm{~cm}$. First maturing size for female for C. leucas is ranged between $180-230 \mathrm{~cm}$ total length and for male between 197-226 cm. For Carcharhinus sorrah female is mature when total length between $110-118 \mathrm{~cm}$ and for female between $103-128 \mathrm{~cm}$. Size range of all sharks species sampled from August 2015 to January 2016 are shown in Table 10B (i). Almost all shark species sampled between February to July 2016 were mature except for Carcharhinus sorah. Size range of all sharks sampled from February to July 2016 are shown in Table 10B (ii).
Table 10A (i): Size Range of Rays (Disc Length) Except for Rhinobatos cf. borneensis, Narcine spp., Rhychobatus australiae, R. laevis and Temera hardwickii (Total Length) from August 2015 to January 2016. All Measurements in cm.

### 2.1.7 Usage and Marketing

Information on marketing at this landing site indicated that most sharks and rays meat were 'consumed locally and some were exported to Singapore. Ray's skin was exported to Thailand. The major markets were also in Perak, Johor, Penang and Kuala Lumpur. The price (RM/kg) varied according to species, size and season. The most expensive ray species Maculabatis gerrardi was sold at RM6 - RM21 followed by Urogymnus granulatus (RM15-RM20) Maculabatis pastinacoides (RM12 - RM15), Neotrygon kuhli (RM2 - RM12), Rhynchobatus australiae (RM7-RM12), R. laevis (RM8 - RM10) and Rhinobatos cf. borneensis at RM4-RM10/kg. The cheapest rays were electric rays (Narcine spp and Temera hardwickii) were sold at RM0.6-RM0.7/kg to fishmeal processing plant. Fins from big size Rhynchobatus australiae were sold separately with the price ranging between RM100-300/kg based on sizes. In general, bigger sized rays were more expensive than the smaller ones. Ray's skin is processed before being sent to Thailand. Transport agent has been assigned to manage the ray's skin to be sent to Thailand's Border for processing in Thailand.

The most expensive sharks Carcharhinus leucas was sold at RM7-RM40, Carcharhinus sorrah at RM6-RM12 and Galeocerdo cuvier at RM8-10/kg. Market destinations for sharks and rays were similar. Some species such as Chiloscyllium hasseltii and C. punctatum were marketed to Penang where they are mainly used in traditional Indian cuisine. Atelomycterus marmoratus and A. erdmanni were also marketed to Penang. Fins of adult Carcharhinus leucas, C. sorrah, C. brevipinna and C. limbatus were sold separately, with the price ranging between RM70-RM150 respectively based on sizes.

Normally the price at wet markets was about $20-50 \%$ higher than at landing site. The price was almost consistent for the whole year for all species but can fluctuate up to $50 \%$ when supply was limited and during festive seasons such as Chinese New Year and Hari Raya especially for species such as Maculabatis gerarrdi, Brevitrygon heterura, Telatrygon biasa, Neotrygon orientalis, Hemitrygon akajei and Rhynchobatus australiae for rays and, Carcharhinus sorrah and C. leucas for sharks. All sharks and rays were landed whole with fins. The details are shown in Table 11. Small, medium and big size category for each species is as shown in Appendix III.

### 2.2 Manjung Utara

### 2.2.1 Landing Samples

A total of 308 landings were sampled during the study period. The highest landings by month was 30 in April 2016 followed by 29 in March and 28 in June 2016. The highest by gear type was 113 Zone C trawl net, followed by 72 of longline, 64 of drift net and 47 Zone B trawl net. The details are shown in Table 12.

### 2.2.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks at Manjung Utara was trawl net at 2,170 kg (39.7\%) followed by drift net at $414.5 \mathrm{~kg}(7.65)$ while longline which operated up to 30 nautical miles from the coastline landed the highest rays at $2,571 \mathrm{~kg}(47.1 \%)$ followed by drift net at $231 \mathrm{~kg} \mathrm{(4.2} \mathrm{\%)} \mathrm{and} \mathrm{handline}$ at $66 \mathrm{~kg}(1.2 \%)$. Most trawlers operated beyond eight nautical miles from the coastline. Zone C trawl net landed the highest at $2,067 \mathrm{~kg}$ followed by Zone B at 67.5 kg and Zone C 2 at 35.6 kg . The highest landing of rays by month was from longline at 918 kg (May 2015) while in December 2015 and November 2015 were 284 kg and 248 kg respectively. The highest landing of sharks by month came from Zone C trawl net in February 2016 and November 2015 at 323 kg and 240 kg respectively. The details are shown in Table 13.

### 2.2.3 Sharks and Rays Composition

A total of $469,906 \mathrm{~kg}$ of fish was landed from 308 landings during the study period. Rays and sharks made up $9,068 \mathrm{~kg}$ and $2,588 \mathrm{~kg}(2.0 \%$ and $0.6 \%)$ from the total landing respectively. Landings of bony fish was $458,249.60 \mathrm{~kg}$ or $97.4 \%$. Average landings per month for sharks and rays were 216 kg and 756 kg respectively. The highest landing by month for rays was $1,400 \mathrm{~kg}$ in July 2016, followed by $1,327 \mathrm{~kg}$ in May 2016 and 921 kg in November 2015. For sharks, the highest landing was 328 kg in February 2016 followed by 280 kg in June 2016 and 277 kg in November 2015. In general, the landing of sharks and rays ranged between $0.3-0.9 \%$ and $0.9-4.4 \%$ respectively from total landing. The details are shown in Table 14.

### 2.2.4 Sample Size

A total of 3,800 tails belonging to 2,498 rays and 1,302 sharks were sampled during the study period comprising 14 species of rays and six (6) species of sharks. The most common and abundant rays species were Brevitrygon heterura, Maculabatis gerrardi, Neotrygon orientalis and Telatrygon biasa. Other rays species such as Hemitrygon fluviorum, Pateobatis uarnacoides, Himantura uarnak, Rhinobatos cf. borneensis and Rhynchobatus australiae were rarely landed and only recorded between 1-4 months. The highest number of rays sampled by month was 280 tails in February 2016 followed by 277 tails in November and 212 tails in October 2015.

The most common and abundant sharks species were Chiloscyllium hasseltii, C. punctatum and Atelomycterus marmoratus. All these species were landed throughout the year. Carcharhinus sorrah was recorded in nine months. Other sharks species such as Stegostoma fasciatum and Chiloscyllium indicum only recorded in one and two months respectively during the study period. The highest number sampled by month was 175 tails in February 2016 followed by 127 tails in November and 126 tails in October 2015. The details are as shown in Table 15.

### 2.2.5 Weight of Sharks and Rays by Species

A total of $11,656 \mathrm{~kg}$ was landed from 308 landings comprising $9,068 \mathrm{~kg}$ of rays and $2,588 \mathrm{~kg}$ of sharks. For rays, the highest landing by weight was from species Maculabatis gerrardi amounting to $3,818 \mathrm{~kg}$ followed by $2,660 \mathrm{~kg}$ of Neotrygon orientalis, 907 kg of Maculabatis pastinacoides and 621 kg of Brevitrygon heterura. The highest landing by month for Maculabatis gerrardi was 596 kg in July 2016, followed by 531 kg in November and 380 kg in Disember 2015. For Neotrygon orientalis, the highest landing was 363 kg in September 2015 followed by 348 kg in February and 290 kg in January 2016. For Maculabatis pastinacoides, the highest landing was 825 kg in May followed by 46 kg in June and 19 kg in July 2016. The highest landing for by month for Brevitrygon heterura was 100 kg in April 2016, followed by 93 kg in November 2015 and 81 kg in March 2016. Other important species were Pateobatis fai ( 312 kg ), Telatrygon biasa ( 289 kg ), Himantura uarnak ( 156 kg ) and Taeniurops meyeni ( 119 kg ). Landing of other species was less than 100 kg .

The highest landing of shark species were $1,035 \mathrm{~kg}$ of Chiloscyllium punctatum followed by 860 kg for Chiloscyllium hasseltii and 630 kg for Carcharhinus sorrah. The highest landing by month for Chiloscyllium punctatum was 170 kg in February 2016 followed by 138 kg in November and 128 kg in October 2015. For Chiloscyllium hasseltii, the highest landing was 132 kg in November 2015 followed by 114 kg in February 2016 and 107 kg in December 2015. Landing for Carcharhinus sorrah was the highest in June ( 209 kg ) followed by 197 kg in July and 76 kg in April 2016. Landing of other species was less than 50 kg . The details are shown in Table 16.

### 2.2.6 Size Range of Sharks and Rays

In general from August 2015 to January 2016, both mature and immature rays species were sampled. Most rays species were mature except for Maculabatis gerrardi, Pateobatis jenkinsii, Rhynchobatus australiae and Gymnura poecilura. The average size of Maculabatis gerrardi ranged between 35.4 39.3 cm disc length but no adult sized specimens were available because immediately removed by middlemen upon being landed. First maturing size for Maculabatis gerrardi is about 59.0 cm and for Gymnura poecilura about 45.0 cm disc length. However, almost all of Telatrygon biasa, Neotrygon orientalis, Hemitrygon fluviorum and Rhinobatos cf. borneensis were mature. Most shark species landed were mature except for Carcharhinus sorrah. First maturing size for Carcharhinus sorrah is 90 cm total length. Size range of all sharks and rays species from August to December 2015 are shown in Table 17A (i) and 17A (ii).

Most of rays species landed from January to July 2016 were mature except for Maculabatis gerrardi, Gymnura poecilura, Rhynchobatus australiae and Carcharhinus sorrah. Similar to the August to December 2015 study duration, almost all of these species were juvenile. Others species such as Telatrygon biasa, Hemitrygon fluviorum, Neotrygon orientalis, Brevitrygon heterura and Rhinobatos cf. borneensis were matured. Most shark species were mature except for Carcharhinus sorah. Size range of all sharks and rays species from January to July 2016 are shown in Table 17B (i) and 17B (ii).

### 2.2.7 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally and some were exported to Singapore. The major markets were wholesale market in Kuala Lumpur, and other major towns in Perak such as Taiping, Sitiawan and Ipoh. Skins of some rays species was exported to Thailand. The price ( $\mathrm{RM} / \mathrm{kg}$ ) varied according to species, size and season. The most expensive ray species such as Maculabatis gerrardi was sold at RM6 - RM18 followed by Neotrygon oreentalis (RM1 - RM13) and Rhynchobatus australiae at RM4 RM10. The lowest price of rays species were Telatrygon biasa sold at (RM1-RM5) and Rhinobatos cf. borneensis at RM3-RM5. Ray's skin is processed before being sent to Thailand. Transport agent has been assigned to manage the ray's skin to be sent to Thailand's Border for processing in Thailand.

In general, bigger sized rays and sharks were more expensive than smaller ones. Small size sharks such as Chiloscyllium spp with total length of less than 20 cm were sold locally at RM1-1.5/ kg for local delicacies such as fish ball and Indian curry. Carcharhinus sorrah was sold at RM5 - RM9 and Stegostoma fasciatum at RM8 - RM9. Other sharks species such as Chiloscyllium hasselti, C. indicum and C. punctatum were sold at RM1-RM4. Market destinations for sharks and rays were similar.

The price was almost consistent for the whole year for all species but sometimes fluctuate up to $50 \%$ when supply was limited and during festive seasons such as Chinese New Year and Hari Raya; especially for Maculabatis gerarrdi, maculabatis pastinacoides, Brevitrygon heterura, Telatrygon biasa, Gymnura poecilura, Neotrygon orientalis, Rhynchobatus australiae and Carcharhinus sorrah. All sharks and rays were landed whole with fins. The details are shown in Table 18. Small, medium and big size category for each species is as shown in Appendix III

| Trawl Net <br> C2 | 60 | 18 | 18 | 24 | 36 |  | 33 |  |  | 18 | 36 | 18 | 261 |

Table 21 shows the top 10 catch per unit effort (CPUE) rays species captured by trawl net Zone C, combined for Larut Matang and Manjung Utara. Maculabatis gerrardi topped the list with, 3.43 $\mathrm{kg} / \mathrm{days}$ or $1.46 \mathrm{~kg} /$ hauls followed by Neotrygon orientalis at $0.74 \mathrm{~kg} /$ days or $0.32 \mathrm{~kg} / \mathrm{hauls}$ and Pateobatis fai at $0.38 \mathrm{~kg} /$ days or $0.16 \mathrm{~kg} / \mathrm{hauls}$.

The top three catch per unit effort (CPUE) for sharks were Chiloscyllium punctatum on the top, followed by Chiloscyllium hasseltii and Carcharhinus sorrah. In terms of CPUE (kg/days), Chiloscyllium punctatum recorded 1.00, C. hasseltii at 0.89 and Carcharhinus sorrah at 0.41 . The top 10 CPUE of rays and sharks species captured by trawl net Zone C are shown in Table 21 and Table 22.

Table 21: Top 10 CPUE Rays Species Captured by Trawl Net C during the study period in Perak (Larut Matang and Manjung Utara) (kg/Fishing Effort)

| No. | Scientific Name | Total weight <br> (kg) by Species | CPUE (kg/ <br> day) | CPUE (kg/haul) |

### 2.3 Kota Kinabalu

### 2.3.1 Landing Samples

A total of 274 landings were sampled during the study period with average of 23 samples a month. The samples were catches from trawl nets, that operated mainly in Zone 3 with 137 vessels, followed by 113 vessels in Zone 4 and only 13 and 11 vessels in Zone 5 and Zone 2 respectively. The details are shown in Table 23.

Table 23: Number of Landings by Gear Sampled During Study at Kota Kinabalu (SAFMA Jetty)

### 2.3.2 Fishing Ground and Catch Composition by Gear Type

The total catch of trawl nets that sampled were $11,730 \mathrm{~kg}$ comprising $7,243 \mathrm{~kg}$ of rays ( $62 \%$ ) and 4487 kg of sharks, which is only $38 \%$ of the combined catches. All trawlers operated beyond three nm (nautical miles) from coastline, and mainly between 12-30 nm from the coastline. Only vessels in Zone 5 operates beyond 30 nm from the coastline. A total of $3,398 \mathrm{~kg}$ of rays was landed by Zone 3 trawl nets followed by Zone 4 trawl nets at $3,388 \mathrm{~kg}$. As for sharks, Zone 3 trawl nets also landed the highest catch, with $2,235 \mathrm{~kg}$ followed by Zone 4 trawl nets at $1,841 \mathrm{~kg}$. The highest landing of rays by month was from Zone 3 trawl nets at 611 kg in August 2015 while 484 kg and 440 kg were both from Zone 4 in August 2015 and January 2016 respectively. For sharks, the highest and second highest landing by month came from Zone 3 trawl nets at 396 kg and 307 kg in August and October 2015 respectively and followed by Zone 4 trawl nets at 304 kg in January 2016. The details are shown in Table 24.

### 2.3.3 Sharks and Rays Composition

A total of $1,856,510 \mathrm{~kg}$ of fish was landed from 274 landings during the study period. Rays and sharks made up $7,243 \mathrm{~kg}$ and $4,487 \mathrm{~kg}(0.4 \%$ and $0.2 \%)$ from the total landing respectively. Landings of bony fish was $1,844,779.90 \mathrm{~kg}$ or $99.4 \%$. Average landings per month for sharks and rays were 374 kg and 604 kg respectively. The highest landing by month for rays was $1,157 \mathrm{~kg}$ in August 2015, followed by 804 kg in January and 714 kg in June 2016. The highest landing for sharks was 536 kg in January 2016, followed by 506 kg in August and 442 kg in December 2015. In general, the landing of sharks and rays ranged between $0.2-0.3 \%$ and $0.2-0.7 \%$ respectively from total landing. The details are shown in Table 25.

### 2.3.4 Sample Size

A total of 4,771 tails belonging to 2,546 rays and 2,225 sharks were sampled during the study period comprising 20 species of rays and 17 species of sharks. The most common and abundant rays species were Neotrygon orientalis followed by Maculabatis gerrardi and Telatrygon biasa. All these species were landed throughout the year. Other common rays species were Rhinobatos borneensis Gymnura poecilura, Rhynchobatus australiae, and Pastinachus gracilicaudus. These species were recorded between 8-11 months. Hemitrygon parvonigra and Pateobatis jenkinsii were recorded in six (6) nd four (4) months respectively. Other species such as Gymnura japonica, H. uarnak, Aetomylaeus vespertilio, Pateobatis fai, H. leoparda, Pateobatis uarnacoides, Mobula japanica, Rhinoptera jayakari, Taeniura lymma and Taeniurops meyeni, were only landed between 1-5 months. The highest number of rays sampled by month was 331 tails in January 2016 followed by 318 tails in November and 272 tails in December 2015.

The most common and abundant sharks species were Chiloscyllium punctatum and C. plagiosum. All these species were landed throughout the year. Other common sharks species were Carcharhinus sorrah, Atelomycterus marmoratus, Sphyrna lewini and Hemipristis elongata. All these these species were landed between 10-12 months. Other species such as Hemigaleus microstoma, Heterodontus zebra and Mustelus manazo were landed in four months; Alopias pelagicus and Loxodon macrohinus in three (3) months, while Carcharhinus brevipinna, Carcharhinus sealei, Halaelurus buergeri, Orectolobus leptolineatus, Squatina tergocellatoides and Stegostoma fasciatum were only landed between 1-2 months. The highest number of sharks sampled by month was 257 tails in January 2016, followed by 253 tails in September and 249 tails in December 2015. The details are as shown in Table 26.
Table 26: Sample Size of Sharks and Rays by Species at Kota Kinabalu (SAFMA Jetty)

### 2.3.5 Weight of Sharks and Rays by Species

A total of $11,711 \mathrm{~kg}$ was landed from 274 landings comprising $7,224 \mathrm{~kg}$ rays and $4,487 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was from species Neotrygon orientalis amounting to $2,733 \mathrm{~kg}$, followed by Maculabatis gerrardi $1,717 \mathrm{~kg}, 952 \mathrm{~kg}$ for Telatrygon biasa and 465 kg for Pastinachus gracilicaudus. The highest landing by month for Neotrygon orientalis was 334 kg in February, followed by 332 kg in June 2016 and 312 kg in November 2015. For Maculabatis gerrardi, the highest landing was 298 kg in August 2015, followed by 204 kg in June and 195 kg in March 2016. For Telatrygon biasa, the highest landing was 166 kg in January followed by 127 kg in May 2016 and 120 kg in December 2015. The highest landing for Pastinachus gracilicaudus was in August 2015 (137 kg) followed by 116 kg in January and 62 kg in June 2016. Weigh of others species such as Rhinoptera jayakari was 281 kg , Rhinobatus borneensis (177kg), Hemitrygon parvonigra (165 kg), Gymnura poecilura (136 kg), Rhynchobatus australiae (149 kg) and Himantura leoparda (112 $\mathrm{kg})$. Weight of other species was below 100 kg .

The highest landing of shark species were $2,201 \mathrm{~kg}$ for Chiloscyllium punctatum followed by $1,017 \mathrm{~kg}$ for C. plagiosum, 469 kg for Carcharhinus sorrah, 266 kg for Sphyrna lewini, 162 kg for Alopias pelagicus, and 147 kg for Atelomycterus marmoratus. The highest landing by month for Chiloscyllium punctatum was 292 kg in January 2016, followed by 250 kg in December 2015 and March 2016 respectively. For Chilosycyllium plagiosum, the highest landing was 197 kg in August followed by 132 kg in October and 127 kg in September 2015. The highest landing for Carcharhinus sorrah was 88 kg in June followed by 84 kg in July 2016 and 76 kg in August 2015. The highest landing for Sphyrna lewini was in July 2016 ( 83 kg ), Alopias pelagicus in January 2016 and for Atelomycterus marmoratus in January $2016(25 \mathrm{~kg})$. Weight of other species was below 50 kg . The details are shown in Table 27.

### 2.3.6 Size Range of Sharks and Rays

During the first six (6) months of the project, from August 2015 to January 2016, most rays species sampled in general were juvenile, except for some species that matured such as Hemitrygon parvonigra caught in November and Disember 2015, Rhinobatos borneensis (August 2015 to January 2016) and Taeniura lymma caught in September 2015. Size range of all rays species from August 2015 to January 2016 are shown in Table 28A (i) from February to July 2016, some rays species were mature such as Hemitrygon parvonigra that caught in February, Telatrygon biasa and Rhinobatos borneensis almost throughout the period. Size range of all rays species sampled from February to July 2016 in Table 28A (ii).

As for sharks, some species sampled from August 2015 to January 2016 were mature such as Atelomycterus marmoratus, Chiloscyllium plagiosum and C. punctatum. Halaelurus buergeri sampled in August 2015 and January 2016, and Hemigaleus microstoma in August 2015 were also mature. Other species such as Heterodontus zebra, Laxodon macrorhinus, Mustelus manazo and Orectolobus leptolineatus were also mature. Size range of all sharks species sampled from August 2015 to January 2016 are shown in Table 28B (i). During the second phase from February to July 2016, Atelomycterus marmoratus, Chiloscyllium plagiosum and C. punctatum were mature in the whole period. Other species were at juvernile stage or young. Size range of all sharks species sampled from February to July 2016 are shown in Table 28B (ii).

### 2.3.7 Usage and Marketing

As a non-targeted species, and the landings represent only less than $1 \%$ of trawl nets total catch, sharks and rays are mainly consumed locally. The price (RM/kg) varied according to species, size and season. For rays, the catches are for local consumption as well as for outside markets, especially to Peninsular Malaysia. Grilled rays are special delicacies that highly enjoyed by locals and tourists alike. At SAFMA landing jetty, wholesale price of rays are between the range of RM1 - RM4 depanding on the species and size. Brevitrygon heterura and Telatrygon biasa were priced RM1 - RM1.50 while Neotrygon orientalis and Rhychobatus australiae can fetch up to RM4/kg. The prices were eventually doubled or even more once the rays sold at the fish markets. Among the favourite species for consumption are Himantura uarnak, Maculabatis gerarrdi, Urogymnus granulatus, Himantura leoparda and Urogymnus asperrimus.

Ray's skin for some species can fetch a bigger value than the meat. Ray's skin of Pateobatis uarnacoides, Maculabatis gerrardi, Maculabatis pastinacoides, Urogymnus lobistoma, Pateobatis jenkinsii, Pateobatis fai, Pastinachus ater, P. gracilicaudus and P. solocirostris is processed before being sent to Kuala Lumpur by plane or container. The prices are varied according to species and size of skin.

For sharks, except for the fins, shark meat are mostly to cater domestic demand and sold mainly at fish wet markets in Kota Kinabalu, though some were brought to interior part of Sabah. Some of the fins, however, are exported mainly to Penisular Malaysia. All part of sharks are fully utilised. For example, sharks teeths and jaws are used as souvenirs and shark head's skin are considered as a new delicacy.

Whole sharks body, without the fins, are sold at the average price of RM2.50 at SAFMA landing jetty in Kota Kinabalu. The prices however increased to double or even triple once its reach the fish markets. For example, Carcharhinus sorrah and Chiloscyllium plagiosum are sold at RM2/kg at SAFMA jetty before sold at RM4/kg at nearby Kota Kinabalu fish market. The same species of sharks fetch higher value, as expensive as RM6/kg at fish markets that situated outside of Kota Kinabalu City. The details of the price range and market destination by species is shown in Table 29.

Table 29: Price of Sharks and Rays by Species and Market Destination in Kota Kinabalu

| Species | Range <br> Price <br> (RM/kg) | Part | Market Destination |
| :--- | :---: | :---: | :--- |
| Rays |  |  |  |
| Aetobatus ocellatus | $2-2.5$ | Whole body | Local (Kota Kinabalu), P. Malaysia |
| Aetomylaeus vespertilio | $2.5-3.0$ | Whole body | Local (Kota Kinabalu), P. Malaysia |
| Hemitrygon pavronigra | $2.0-3.0$ | Whole body | Local (Kota Kinabalu), P. Malaysia |
| Telatrygon biasa | $1.5-3.0$ | Whole body | Local (Kota Kinabalu) |
| Gymnura japonica | $2.0-2.5$ | Whole body | Local (Kota Kinabalu) |
| Gymnura poecilura | $2.0-2.5$ | Whole body | Local (Kota Kinabalu) |
| Pateobatis fai | $2.5-3.0$ | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; <br> Skin sold to Peninsular Malaysia |
| Maculabatis gerrardi | $2.0-2.5$ | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; <br> Skin sold to Peninsular Malaysia |

| Species | Range Price (RM/kg) | Part | Market Destination |
| :---: | :---: | :---: | :---: |
| Pateobatis jenkinsii | 2.0-2.5 | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; Skin sold to Peninsular Malaysia |
| Himantura leoparda | 2.0-2.5 | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; Skin sold to P. Malaysia |
| Pateobatis uarnacoides | 2.5-3.0 | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; Skin sold to P. Malaysia |
| Himantura uarnak | 1.5-3.0 | Whole body, skin | Local (Kota Kinabalu), P. Malaysia; Skin sold to P. Malaysia |

| Orectolobus leptolineatus | $2.0-2.5$ | Whole body | Local Market (Kota Kinabalu) |
| Sphyrna lewini | $3.0-3.5$ | Whole body, fins | Local Market (Kota Kinabalu) |
| Squatina tergocellatoides | $2.0-2.5$ | Whole body | Local Market (Kota Kinabalu) |
| Stegostoma fasciatum | $2.5-4.0$ | Whole body | Local Market (Kota Kinabalu) |

### 2.4 Sandakan

### 2.4.1 Landing Samples

A total of 135 landings were sampled during the study period with average of 12 samples a month. The samples were catches from trawl nets, that operated mainly in Zone 3 with 84 vessels, followed by 29 vessels in Zone 2 and 22 vessels in Zone 4. The details of are shown in Table 30.

### 2.4.2 Fishing Ground and Catch Composition by Gear Type

The total catch of trawl nets that sampled were $13,138 \mathrm{~kg}$ comprising $10,170 \mathrm{~kg}$ of rays ( $77.4 \%$ ) and $2,969 \mathrm{~kg}$ of sharks, which is only $22.6 \%$ of the combined catches. All trawlers operated beyond three nm from coastline, and mainly between 12 nm to 30 nm from the coastline. A total of $5,611 \mathrm{~kg}$ of rays was landed by Zone 3 trawl nets followed by Zone 4 trawl nets at $3,279 \mathrm{~kg}$. As for sharks, Zone 3 trawl nets also landed the highest catch, with $1,882 \mathrm{~kg}$ followed by Zone 4 trawl nets at 677 kg . The highest landing of rays by month was from Zone 3 trawl nets at $1,217 \mathrm{~kg}$ in August while 788 kg , also from Zone 3 in January and followed by 703 kg from Zone 4 in August. For sharks, the highest landing by month came from Zone 3 trawl nets at 532 kg in September 2015, followed by 331 kg from Zone 4 trawl nets in August 2015 and 240 kg from Zone 3 trawl nets in July 2016. The details are shown in Table 31.

### 2.4.3 Sharks and Rays Composition

A total of $581,358 \mathrm{~kg}$ of fish was landed from 135 landings during the study period. Rays and sharks made up $10,170 \mathrm{~kg}$ and $2,969 \mathrm{~kg}(1.8 \%$ and $0.5 \%)$ from the total landing respectively. Landings of bony fish was $568,220 \mathrm{~kg}$ or $97.7 \%$. Average landings per month for sharks and rays were 247 kg and 848 kg respectively. The highest landing by month for rays was $1,987 \mathrm{~kg}$ in August, followed by $1,096 \mathrm{~kg}$ in September 2015 and 998 kg in January 2016. However, the highest landing for sharks was 611 kg in August, followed by 561 kg in September and 321 kg in November 2015. In general, the landing of sharks and rays ranged between $0.2-1.1 \%$ and $0.8-3.2 \%$ respectively from total landing. The details are shown in Table 32.

Table 32: Catch Composition of Sharks, Rays and Bony Fish by Month from 135 Landings at Sandakan (Sandakan Fish Market Jetty). All Weight in Kilogram

### 2.4.4 Sample Size

A total of 1,733 tails belonging to 882 rays and 851 sharks were sampled comprising 19 species of rays and 14 species of sharks. The most common and abundant rays species were Neotrygon orientalis followed by Maculabatis gerrardi and Taeniura lymma. The most common species were Patobatis jenkinsii, Rhynchobatus australiae, Pateobatis uarnacoides, Rhinoptera jayakari, Himantura uarnak, Pateobatis fai, Himantura leoparda and Pateobatis uarnacoides. These species were recorded between 11-12 months. Other species such as Aetobatus ocellatus and Telatrygon biasa were landed in seven months; Pastinachus gracilicaudus and Rhina encylostoma in five months during study period. The highest number of rays sampled by month was 145 tails in August 2015 followed by 88 tails in July and 85 tails in June 2016.

The most common and abundant shark species were Chiloscyllium punctatum followed by Carcharhinus sorrah and Chiloscyllium plagiosum. Common species were Atelomycterus marmoratus, Rhizoprionodon acutus, Sphyrna lewini, Carcharhinus sealei, Hemigaleus microstoma and Stegostoma fasciatum. All these species were landed between 8-12 month. Other species such as Hemipristis elongata, Carcharhinus limbatus, C. leucas, C. brevipinna and Galeocerdo cuvier, were only landed between 3-7 months during the study period. The highest number of sharks sampled by month was 196 tails in August, followed by 74 tails in September 2015 and 69 tails in May 2016. The details are as shown in Table 33

### 2.4.5 Weight of Sharks and Rays by Species

A total of $13,138 \mathrm{~kg}$ was landed from 135 landings comprising $10,170 \mathrm{~kg}$ rays and $2,969 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was from species Pateobatis fai amounting to $2,315 \mathrm{~kg}$, followed by H. uarnacides ( $1,465 \mathrm{~kg}$ ), H. leoparda ( $1,367 \mathrm{~kg}$ ), Maculabatis gerrardi $(1,013 \mathrm{~kg}$ ), Pateobatis jenkinsii ( 985 kg ), Himantura uarnak ( 896 kg ) and Neotrygon orientalis ( 571 kg ). The highest landing by month was 445 kg for Pateobatis fai in August, followed by 331 kg in September 2015 and 287 kg in January 2016. For Pateobatis uarnacoides, the highest landing was 421 kg in August 2015, followed by 176 kg in January 2016 and 121 kg in December 2015. For Himantura leoparda, the highest landing was 211 kg in May 2016 followed by 187 kg in November and 182 kg in August 2015. The highest landing for Maculabatis gerrardi and Pateobatis jenkinsii was in August 2015 at 119 kg and 380 kg respectively. For Himantura uarnak, the highest landing was 168 kg in September 2015and for Neotrygon orientalis was 88 kg in August 2015. Weight of other species was less than ranged between 2 kg (Brevitrygon heterura) to 382 kg (Rhynchobatus australiae).

The highest landing of shark species were 896 kg for Chiloscyllium punctatum followed by 695 kg for Carcharhinus sorrah, 343 kg for Stegostoma fasciatum, 297 kg for Carcharhinus leucas, and 251 kg for Chiloscyllium plagiosum. The highest landing by month for Chiloscyllium punctatum was 190 kg in September, followed by 135 kg in August and 108 kg in November 2016. For Carcharhinus sorrah, the highest landing was 235 kg in August 2015 followed by 110 kg in July 2016 and 69 kg in September 2015. The highest landing for Stegostoma fasciatum was 88 kg in August, followed by 72 kg in December and 66 kg in September 2015. Weight of other species ranged between 21 kg (Galeocerdo cuvier) to 95 kg (Atelomycterus marmoratus). The details are shown in Table 34.

### 2.4.6 Size Range of Sharks and Rays

In general from August 2015 to January 2016, both mature and immature rays species were sampled. Mature species included Telatrygon biasa sampled in August and September 2015, Pateobatis fai (August, September, October 2015), Pateobatis jenkinsii (August, Disember 2015 and January 2016), Himantura leoparda (August and November 2016), Pateobatis uarnacoides (August, September, November, December 2015 and January 2016), Himantura uarnak (August and November 2015), Rhynchobatus australiae (August and October 2015) and Taeniura Iymma in October and November 2016. Other species were mostly immature. Size range of all rays species sampled from August 2015 to January 2016 are shown in Table 35A (i).

During the second period from February to July 2016, mature rays species were Pateobatis jenkinsii sampled in March and April, Himantura leoparda (April and July), Pateobatis uarnacoides (March and April), Himantura uarnak (March, April and July), and Taeniura lymma in February, March, May, June and July. Other species were mostly immature. Size range of all rays species sampled from February to July 2016 are shown in Table 35A (ii).

As for sharks, in general from August 2015 to January 2016, both mature and immature species were sampled. Mature species included Atelomycterus marmoratus sampled from August 2015 to January 2016, Chiloscyllium plagiosum (August, October and November 2015), C. punctatum (September and December 2015), Hemigaleus microstoma (August, October, November and December 2015) and Stegostoma fasciatum in September, November and December 2015. First maturing size of these species (total length) are 45 cm for male Atelomycterus marmoratus, 50 cm for Chiloscyllium plagiosum, and 147 cm for Stegostoma fasciatum. Other species were mostly immature such as Carcharhinus leucas, C. limbatus, C. sorrah, C. sealei, Galeocerdo cuvier, Rhizoprionodon acutus and Sphyrna lewini. Size range of all sharks species from August 2015 to January 2016 are shown in Table 35B (i).

During the second period from February to July 2016, most mature sharks species were Atelomycterus marmoratus and Chiloscyllium plagiosum sampled from Febuary to July, Chiloscyllium punctatum (May and June), Hemigaleus microstoma (March and May), and Stegostoma fasciatum in April and June. Other species were mostly immature. Size range of all sharks species sampled from February to July 2016 are shown in Table 35B (ii).

### 2.4.7 Usage and Marketing

The scenario for usage and marketing for sharks and rays in Sandakan is more or less are similar to Kota Kinabalu. Sharks and rays are mainly consumed locally. For rays, the catches are for local consumption as well as to fullfill demand from Peninsular Malaysia. At Sandakan Fish Market jetty, wholesale price of rays are between the range of RM0.80 - RM4/kg depanding on the species. Neotrygon orientalis and Telatrygon biasa are priced as cheap as RM $0.80 / \mathrm{kg}$ while Pastinachus ater, Rhinobatos borneensis and Rhychobatus australiae can fetch a price as high as RM4/kg. The prices are eventually doubled or even more once the rays sold at the fish markets. Ray's skin can fetch a bigger price than the meat. The prices are varied according to species and size of skin. Ray's skin is processed before being sent to Kuala Lumpur by plane or container. The prices are varied according to species and size of skin.

For sharks, shark meat are mostly to cater domestic demand and sold mainly at fish wet markets in Kota Kinabalu. While shark fins soup are still served in some chinese restaurants in Sandakan, some are sent mainly to Peninsular Malaysia. Apart from the fin and meat, other parts of sharks such as the teeth, jaw and skin are all fully utilised. For example, sharks teeths and jaws are used as souvenirs and shark head's skin are considered as a new delicacy.

Whole sharks body, without the fins, are sold between RM0.80-RM2.50/kg at Sandakan Fish Market jetty. The prices however increased to double or even triple once its reach the fish markets. For example, Carcharhinus sorrah are sold up to RM2.50/kg at Sandakan Fish Market jetty but the price doubled at nearby fish markets. The details of the price range and market destination by species is shown in Table 36. Small, medium and big size category for each species is as shown in Appendix III

Table 36: Price of Sharks and Rays by Species and Market Destination in Sandakan

| Species | Range <br> Price <br> (RM/kg) | Part | Market Destination |
| :--- | :--- | :--- | :--- |
| Rays |  |  |  |
| Aetobatus ocellatus | $1.5-3.0$ | Whole body | Local (Sandakan), Peninsular <br> Malaysia |
| Telatrygon biasa | $0.8-1.0$ | Whole body | Local (Sandakan) |
| Pateobatis fai | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |
| Maculabatis gerrardi | $0.8-2.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |
| Pateobatis jenkinsii | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |
| Himantura leoparda | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |

| Species | Range <br> Price <br> (RM/kg) | Part | Market Destination |
| :--- | :--- | :--- | :--- |
| Pateobatis uarnacoides | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |
| Himantura uarnak | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |
| Urogymnus granulatus | $1.5-3.5$ | Whole body, skin | Local (Sandakan), Peninsular <br> Malaysia; Skin sold to <br> Peninsular Malaysia |

| Trawl Net Zone 5 | 24 |  |  |  | 66 | 87 | 21 |  | 45 |  | 39 |  | 282 |

The top 10 catch per unit effort (CPUE) ray species captured by trawl net, combined for Kota Kinabalu and Sandakan, differed between zone. For zone 3, Maculabatis gerrardi topped the list with 1.21 kg per days or 0.40 kg per hauls, followed by Neotrygon orientalis with 1.07 kg per days or 0.36 per hauls. For zone 4 , Neotrygon orientalis was on top of the list with 1.48 kg per days or 0.49 kg per hauls compare with Pateobatis fai with 1.00 kg per days or 0.33 kg per hauls. The same species that dominated in both zone 3 and zone 4 are Maculabatis gerrardi, Pateobatis fai, Pateobatis uarnacoides, Himanturan leoparda, Himantura uarnak, Neotrygon orientalis, Pastinachus gracilicaudus, Telatrygon biasa and Rhynchobatus australiae.

The first 3 species of sharks in the top 10 catch per unit effort (CPUE) for both zone 3 and zone 4 were in the same order, with Chiloscyllium punctatum on the top, followed by Chiloscyllium plagiosum and Carcharhinus sorrah. In terms of CPUE (kg/days), Chiloscyllium punctatum recorded 1.15, C. plagiosum with 0.50 and Carcharhinus sorrah with 0.42 in zone 3 compare to $1.12,0.39$ and 0.36 in zone 4 respectively. The top 10 CPUE of rays and sharks species captured by trawl net zone 3 and zone are shown in Table 39A and Table 39B.

Table 39A: Top 10 CPUE ray species captured by Trawl Net Zone 3 during the study period in Sabah (Kota Kinabalu and Sandakan)

### 4.0 FUTURE ACTIVITIES

Malaysia is highly commited in managing and conserving its sharks and rays. Some future activities had been underlined, as follows;
i. Continuing to record landing data up to species level at the existing sites.
ii. Extending the program to other states in Malaysia.
iii. Seeking national funding to;
a. Continue the sharks data collection program
b. Conduct trainings/courses at national level
c. Attend meetings and seminars at national and international level
d. Conduct public awareness
e. Publish materials (posters, templates, identification manuals)
iv. Using the current program finding to ;
a. Conduct Non-detriment Findings (NDFs) study on sharks.
b. Rectify various issues concerning sharks management ant national and international level.
c. Provide input for the next Malaysia NPOA-Shark.
v. Conducting training for fisheries staff on sharks data collection (SEAFDEC, Terengganu and on-sites)
vi. Continuing public awareness campaign, such as on the current regulation of listing on endangered species, government policy on not serving shark fin soup during official events and rectifying the misconception of 'shark finning' and 'shark fishing' terms.
vii. Enhancing enforcement capacity through relevant training, such as the identification of sharks and rays species and its parts.
viii. Expending the ongoing study on the usage and marketing, as well as the socio-economy related to sharks and rays in Sabah, to other states of Malaysia.

### 5.0 CONCLUSION

A project on recording landing data of sharks and rays up to species level was conducted in two districts in the State of Perak and Sabah respectively. During this project thirteen (13) staff from Department of Fisheries Malaysia and Department of Fisheries Sabah trained in taxonomy and in data collection using the agreed regional format. Two facing the Straits of Malacca, namely Larut Matang and Manjung Utara in Perak, and Kota Kinabalu and Sandakan in Sabah were selected as the study sites, as they were the main landing sites of sharks and rays in the states. The landing data were collected at thirteen (13) jetties in Perak and two (2) jetties in Sabah.

A total of thirty three (33) species of rays from five (5) Order and nine (9) Families while twenty (20) species of sharks from four (4) Order and five (5) Families were recorded during the study period in Perak.

Larut Matang recorded nineteen (19) species of rays from three (3) Orders and five (5) Families, and fourteen (14) spesies of sharks from two (2) Orders and three (3) Families. Whereas Manjung Utara recorded fourteen (14) species of rays from two (2) Order and four (4) Families, and six (6)
species of sharks from two (2) Orders and three (3) Families. Details are shown in Appendix I. In term of percentage of total marin landings, rays and sharks contributed $2.03 \%$ and $0.56 \%$ at Larut Matang, while for Manjung Utara at $1.38 \%$ and $0.38 \%$ for rays and sharks respectively.

The most abundant sharks species at Larut Matang were Chiloscyllium hasseltii, Chiloscyllium punctatum, Atelomycterus marmoratus and Carcharhinus sorrah while for rays were Neotrygon orientalis, Maculabatis gerrardi, Brevitrygon heterura and Telatrygon biasa. The most abundant sharks species at Manjung Utara were Chiloscyllium hasseltii, Chiloscyllium punctatum and Atelomycterus marmoratus while for rays were Brevitrygon heterura, Maculabatis gerrardi, Neotrygon orientalis, and Telatrygon biasa.

A total of twenty one (21) species of sharks from five (5) Orders and eleven (11) Families while twenty five (25) spesies of rays from two (2) Orders and eight (8) Families were recorded during the study period in Sabah. Kota Kinabalu recorded the highest with seventeen (17) species of sharks and twenty (20) rays compare to Sandakan with fourteen (14) species of sharks and nineteen (19) rays (Appendix II). For Sabah, the landings of sharks and rays were also minimal, with the contribution of $0.24 \%$ and $0.39 \%$ at Kota Kinabalu, and $0.53 \%$ and $1.81 \%$ at Sandakan respectively. These figures confirmed earlier data as published in Malaysian National Statistics that sharks and rays were only by-catch and not targeted and contributed less than $2 \%$ of the total marine landing.

For Sabah, the most abundant sharks species at Kota Kinabalu were Chiloscyllium punctatum followed by Chiloscyllium plagiosum and Atelomycterus marmoratus and rays Neotrygon orientalis followed by Maculabatis gerrardi and Telatrygon biasa. The most common sharks species were Chiloscyllium punctatum, Chiloscyllium hasseltii and Carcharhinus sorrah while for rays Neotrygon orientalis, followed by Maculabatis gerrardi and Telatrygon biasa.

In the district of Sandakan, the most abundant sharks species were Chiloscyllium punctatum followed by Carcharhinus sorrah and Chiloscyllium plagiosum, and rays Neotrygon orientalis followed by Maculabatis gerrardi and Taeniura lymma. The most common sharks species were Chiloscyllium punctatum, Carcharhinus sorrah, Atelomycterus marmoratus and Rhizoprionodon acutus while for rays Neotrygon orientalis, followed by Maculabatis gerrardi, Pateobatis jenkinsii and Rhynchobatus australiae.

In Perak, sharks and rays were caught mainly by trawl nets. Other gears used were longlines and drift nets. In Sabah, trawl net is the main gear to catch sharks and rays.

The top 10 catch per unit effort (CPUE) (kg/days and kg/hauls) for rays species captured by trawl net Zone C in Perak were Neotrygon orientalis, Maculabatis gerrardi and Brevitrygon heterura, while for sharks were dominated by Chiloscyllium hasseltii, Chiloscyllium punctatum and Carcharhinus sorrah.

The top 10 catch per unit effort (CPUE) ray and shark species captured by trawl net, combined for Kota Kinabalu and Sandakan, were determined in zone 3 and zone 4. For ray, Maculabatis gerrardi topped the list, followed by Neotrygon orientalis and Pateobatis fai in zone 3. In zone 4, Neotrygon orientalis was the main species, followed by Pateobatis fai and Pateobatis uarnacoides. For shark, the top 3 species for both zone 3 and zone 4 were in the same order, with Chiloscyllium punctatum came first, followed by Chiloscyllium plagiosum and Carcharhinus sorrah.

Usage and marketing information from this study confirmed that all sharks and rays were landed whole, fully utilised with no finning activities on board of vessels.

### 1.0 INTRODUCTION

Myanmar has a rich diversity of sharks (locally call 'nga-man'), rays and skates (nga-leik-kyauk). Ahmad and Lim (2012) in their Field Guide to Sharks of the Southeast Asian Region lists 34 shark and 44 ray species for Myanmar. However, Howard et al, (2015) reported that based on their studies at several landing sites as well as a review of literature on shark studies suggest there may be as many as 58 species of sharks and 71 species rays and skates found in Myanmar waters. The high diversity of sharks was recorded from the Order Carcharhiniformes with 43 species followed by Order Orectolobiformes and Squaliformes with six (6) species respectively. However, low diversity was recorded for the Orders Lamniformes, Hexanchiformes and Squatiniformes where only one (1) species were recorded from each Order. As for batoids, high diversity was recorded for the Order Myliobatiformes with 46 species followed by Rhinobatiformes (11 species) and Torpediniformes (nine (9) species). Only three (3) species were recorded from Order Pristiformes and two (2) species for Order Rajiformes.

Even though the number of chondrichthyans species recorded in Myanmar was more than 129, the actual status of its biodiversity is still unknown. With new species continuously discovered in Andaman Sea, the number is expected to increase in the future. At present the deep water species are mostly unknown due to limited research activity. Most sharks and rays species landed especially from the Families Carcharhinidae and Dasyatidae and are difficult to identify up to species level by untrained and inexperienced enumerators. Only trained staff will be better able to make the right and valid identification of species in the future.

### 1.1 Objective

The objectives of this project were:

- to enhance human resource development in elasmobranch taxonomy, and
- to develop landing data recording from generic 'sharks' and 'rays' to species level.

### 1.2 Data Collection at Landing Sites

### 1.2.1 Selection of Study Sites

The main sharks and rays fishing grounds in Myanmar are in Rakhine State, Mon State and Ayeyarwaddy Region. For the purpose of this studies, data and information were collected from Ye Township in Mon State and Yangon Region. The landing data were collected at three landing jetties namely Annawar Aung, Shwe Zinyaw Hein and Annawar Holding Fisheries in Yangon Region, and two jetties in Ye Township namely Zee Phyu Thaung and Asin in Mon State. The landing sites are private enterprises with all sharks and rays landing coming from trawlers and giant set bag nets for Yangon Region, and small set bag nets, gillnets, stow net and longlines from Mon State. The location of all landing sites are shown in Figure 1.

Figure 1: Location of Study Sites in Myanmar

### 1.2.1.1 Fisheries Structure and Background of Study Sites

### 1.2.1.2 Yangon Landing Site

Yangon is one (1) of the major landing sites for sharks and rays in Myanmar. All jetties belong to private enterprises. The major gears were trawl nets (502), followed by giant set bag nets (150) and set bag net (50). All trawlers are normally operated by 20-21 crew members. Almost all of the sharks and rays were landed by trawlers and giant set bag nets operating beyond 10 nautical miles from the coastline. Fishing operation normally 90 days per trip. Carrier vessels normally conveying the catch from fishing vessels within 10 to 15 days. The details of fishing vessels registered in Yangon Region are shown in Table 1.

Table 1: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Yangon Landing Site

| Type of Gear | Fishing area | Fishing operation <br> (from coastline) |  | No. of <br> vessels |
| :---: | :---: | :---: | :---: | :---: |
| Trawlers <br> $50-220$ GRT | Ayawaddy, Mon, <br> Rakhine | $>10$ miles | 502 | No. fishers |
| Giant set bag nets <br> $50-220 ~ G R T ~$ | Ayawaddy, Mon, <br> Rakhine | $>10$ miles | 150 | 3,000 |
| Set bag nets <br> $50-220$ GRT | Ayawaddy, Mon | $>10$ miles | 50 | 1,000 |
| Grand Total |  |  | $\mathbf{7 0 2}$ | $\mathbf{1 4 , 0 4 0}$ |

### 1.2.1.3 Ye Township Landing Site

All jetties in Ye Township belong to private enterprises. The major gears were stow nets (217), followed by gillnets, (91) longlines (33), and set bag nets (60). The details of the fishing vessels registered in this district are shown in Table 2. The major gears landing sharks and rays were stow nets, gillnets and longlines. All set bag nets are normally operated by 19-20 crew members and all catches were carried by carrier vessels to jetties. Normally carrier vessels collected the catch three days per trip. The number of crew for traditional gears such as gillnets and longlines was normally 9-10 fishers. The fishing operation for set bag nets was normally 90 days per trip while longlines and gillnets were normally a daily trip. All catches from longlines and gillnets operated in coastal areas were landed within 12 hours.

Table 2: Number of Licensed Fishing Vessels by Gears and Number of Fishers at Ye Township Landing Site

| Type of Gear | Fishing Zone | Fishing operation <br> (from coastline) | No. of Vessels | No. of Fishers |
| :---: | :---: | :---: | :---: | :---: |
| Set Bag Net <br> $15-60$ GRT | Mon | $>10$ miles | 60 | 1,200 |
| Gillnet | Mon | $<10$ miles | 91 | 910 |
| Longline | Mon | $<10$ miles | 33 | 132 |
| Stow Net | Mon | $<10$ miles | 217 | 651 |
| Grand Total |  |  | 401 | $\mathbf{2 , 8 9 3}$ |

### 1.3 Appointment of Enumerators

Three (3) Assistant Fisheries Officers from the Region and State Fisheries Office of Yangon Landing Site were appointed as enumerators. Their names and addresses are as follows:

## Yangon Landing Site

1. Mr. Min Naung (Director, Ayawaddy Division)

No.312, North Okalar Pa Township, Rose Road.
Yangon Division.
Tel: +959044224257
2. Mr. Soe Win (Fisheries Officer, Nay Pyi Taw)

No. 39/201, Aung Zaya Housing, Main Road.
Insein Township.
Yangon Division.
Tel: +959450016019
Email. soewinn67@gmail.com
3. Mr. Kyaw Swar Win (Assistant Officer, Yangon Division)

No.33, Bank Road, Kyauk-ta-tar Township, DoF Apartment.
Yangon Division.
Tel. +959798571391

## Ye Township Landing Site

1. Mr. Soe Nyunt (Deputy Director, Mon State) DoF Housing, Thein-gone Road, Mawlamyine. Mon State. Tel: +959450003916
2. Mr. Nay Myo Aye (Deputy Officer, Ye Township)

No.104, Bogyoke Road, Yan-gyi-aung Quarter, Ye Township, Mon State.
Tel: +959782244128
Email. naymyo.marine@gmail.com

### 1.4 Materials and Methods

### 1.4.1 Sampling Methods

The sampling activity started in July 2015 until 31 June 2016. All enumerators were requested to record landing data and other related information in a standard form at least five days/month. A Standard Operating Procedure entitled 'SOP Sharks, Rays and Skates Data Collection in the Southeast Asian Waters' was used as a guide. The content included instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of enumerator, name of landing site, date of sampling, vessel registration number, vessel GRT, fishing area, price at landing sites, name of species (common name and scientific name), total catch of sharks, rays, skates, commercial and other species from each sampling vessel. The completed data in excel were then submitted to the respective National Coordinator before submitted to SEAFDEC/ MFRDMD before second week of the following month for verification. The data were analysed at the end of each quarter.

### 1.4.2 Selection of Fishing Vessels and Sampling Activities

Between 1-2 fishing vessels were selected for sampling each day for five (5) days per month at each landing site. Measurement of total length (TL) were taken for all rays, sharks species and
skates species from the Families Rhynchobatidae, Rhinobatidae, Rajidae and Narcinidae. While Disc Length (DL) were taken for all ray species where the tail is frequently absent or damaged (mainly from the Families Dasyatidae, Gymnuridae, Mobulidae, Rajidae and Myliobatidae). All rays, sharks and skates specimens were measured and weighed individually if the total number was less than 50 tails per vessel. If the total number was more than 50 tails, only $10 \%$ were measured. The maturity stage for each individual was estimated according to Yano et al. (2005) and Ahmad and Annie Lim (2012). The total catch of all sharks and rays by species as well as the total catch of commercial and other species were also recorded for each sampling vessel. Some samples were brought back to the Institute of Fisheries Technology, Yangon and preserved for future reference. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3 Classification

The classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ahmad et al. (2013) and Ahmad et al. (2014), and Ebert et al. (2013) and Last et al. (2016).

### 2.0 RESULTS

### 2.1 Yangon Landing Site

### 2.1.1 Landing Samples

A total of three (3) landing sites were sampled during the study period namely Annawar Aung, Shwe Zinyaw Hein and Annawar Holding Fisheries. The highest by month was 17 samples in February 2016 followed by 15 in August and November 2015 and 13 in July, September, October and December 2015. The highest by gear type was 110 of trawl net followed by 15 of giant set bag net and 10 of set bag net. The details are shown in Table 3.

### 2.1.2 Fishing Ground and Catch Composition by Gear Type

A total of $50,465.7 \mathrm{~kg}$ of sharks, rays and skates were landed during the study period. The main gear landing sharks, rays and skates was the trawl net at $27,479.7 \mathrm{~kg}$ ( $54.45 \%$ ) comprising-21,066.6 kg rays, $6,351.9 \mathrm{~kg}$ sharks and 61.2 kg skates, while set bag nets contributed $18,723.8 \mathrm{~kg}(37.10 \%)$ comprising of $17,013.0 \mathrm{~kg}$ of rays and $1,685.9 \mathrm{~kg}$ of shark and 24.8 kg of skates. Giant set bag nets contributed $4,262.2 \mathrm{~kg}(8.45 \%)$ comprising of $3,279.0 \mathrm{~kg}$ rays and 983.3 kg of sharks. Most trawlers operated beyond 10 nautical miles from the coastline in Mon State, Ayawaddy and Rakhine fishing grounds. The highest landing of rays by month was from set net bag at $15,708.5 \mathrm{~kg}$ in April 2016. However, the highest landing of sharks by month came from trawl nets in January 2016 at 1,591.4 kg . The details are shown in Table 4.

### 2.1.3 Sharks, Rays and Skates Composition

Total of $3,697,905.9 \mathrm{~kg}$ of fish was landed during the study period from 135 landings. Sharks, rays and skates made up $9,021.1 \mathrm{~kg}, 41,358.6 \mathrm{~kg}$, and 86.0 kg respectively from the total landing. In term of landing composition, sharks and rays constributed about $0.2 \%$ and $1.1 \%$ respectively. While landings of bony fishers and other species was $3,647,440.2 \mathrm{~kg}$, average landings per month for sharks, rays and skates were $751.8 \mathrm{~kg}, 3,446.5 \mathrm{~kg}$, and 7.2 kg respectively. The highest landing by month for rays was $15,968.9 \mathrm{~kg}$ in April 2016, followed by $4,350.8 \mathrm{~kg}$ in March 2016 and 3,956.6 kg in December 2015. However, the highest landing for sharks was $1,694.2 \mathrm{~kg}$ in January 2016 followed by $1,570.2 \mathrm{~kg}$ in October and $1,529.8 \mathrm{~kg}$ in September 2015. The landing of rays and sharks ranged between $0.4-7.5 \%$ and $0.0-1.2 \%$ respectively. Landing of skates was very small. The average landing of rays and sharks was $1.1 \%$ and $0.2 \%$ respectively from total landing. The details are shown in Table 5.

### 2.1.4 Sample Size

A total of 2,999 tails belonging to 1,668 rays, 1,316 sharks and 15 skates were sampled comprising 37 species of rays 18 species of sharks and two (2) species of skates. The most abundant and common ray species were Brevitrygon heterura followed by Rhinobatos cf. formosensis, Rhinobatos punctifer, Neotrygon orientalis and Gymnura japonica. The highest number of rays sampled by month was 205 in August followed by 187 in September and 172 in November 2015. Other species such as Glaucostegus sp., Dasyatis microps, Himantura uarnak, Brevitrygon imbricata, Gymnura poecilura, Aetobatus flagellum, Hemitrygon sinensis, Brevitrygon cf. javaensis, Pateobatis fai, Mobula kuhlii, Mobula japanica, Plesiobatis daviesi, Rhinoptera adspersa, Narcine lingula, Okamejei sp., Urogymnus asperrimus, Urogymnus lobistoma, Pastinachus gracilicaudus, Pastinachus cf. solocirostris, and Pastinachus stellurostris, were very rare and only landed between 1-7 months during the study period. The details are as shown in Table 6A.

The most common and abundant shark species were Sphyrna lewini, Scoliodon laticaudus, Mustelus sp., Carcharhinus leucas and Mustelus mosis. All these species were landed throughout the year. Other species such Carcharhinus melanopterus, Sphyrna mokarran, Carcharhinus sorrah, and Carcharhinus limbatus were rarely landed and only landed between 1-7 months during the study period. The highest number of sharks sampled by month was 255 in September, followed by 202 in October, 185 in August and 166 in July 2015. The details are as shown in Table 6B.

### 2.1.5 Weight of Sharks, Rays and Skates by Species

A total of $50,465.7 \mathrm{~kg}$ of sharks, rays and skates was landed from three landing sites comprising $41,358.6 \mathrm{~kg}$ rays, $9,021.1 \mathrm{~kg}$ sharks and 86.0 kg skates. For rays, the highest landing by weight was from species Urogymnus asperrimus amounting to $14,501.5 \mathrm{~kg}$ followed by Rhinobatos cf . formosensis ( $5,930.5 \mathrm{~kg}$ ), Brevitrygon heterura ( $3,529.6 \mathrm{~kg}$ ), Rhinobatos punctifer ( $2,528.9 \mathrm{~kg}$ ), Urogymnus granulatus ( $2,411.1 \mathrm{~kg}$ ) and Gymnura japonica ( $2,089.6 \mathrm{~kg}$ ). The highest landing by month was $15,968.9 \mathrm{~kg}$ in April 2016, followed by $4,350.8 \mathrm{~kg}$ in March 2016 and $3,956.6 \mathrm{~kg}$ in December 2015. For Brevitrygon heterura, the highest landing was 894.7 kg in August, followed by 500.8 kg in October and 435.5 kg in November 2015. The highest landing for Rhinobatos cf . formosensis was $1,599.2 \mathrm{~kg}$ in March 2016, followed by $1,201.1 \mathrm{~kg}$ in December and 856.3 kg in September 2015. For Rhinobatos punctifer the highest landing was 786.8 kg in January followed by 395.1 kg in March 2016 and 287.3 kg in November 2015.

The highest shark species landing were $2,802.6 \mathrm{~kg}$ for Sphyrna lewini followed by $2,726.4 \mathrm{~kg}$ for Scoliodon laticaudus and $1,572.3 \mathrm{~kg}$ for Mustelus mosis. The highest landing by month for Sphyrna lewini was 754.4 kg in July followed by 745.2 kg in October and 445.5 kg in August 2015. For Scoliodon laticaudus, the highest landing was 964.7 kg in September followed by 551.4 kg in October and 383.6 kg in August 2015. Landing of skates, Okamejei jenseanae and Okamejei sp. was 64.4 kg and 21.4 kg respectively. The details are shown in Table 7.

### 2.1.6 Size Range of Sharks, Rays and Skates

In general most ray species sampled from July to December 2015 were mature except for Hemitrygon sinensis, Glycostegus sp., Gymnura japonica, Himatura leoparda, Mobula japanica, Pastinachus stellurostris, Rhina encylostoma, Rhinoptera javanica, Rhinoptera jayakari and Rhynchobatus australiae. The average size of Mobula japanica ranged between $22.0-78.0 \mathrm{~cm}$ disc length but no adult sized specimens were available. First maturing size for Mobula japanica is about 90 cm , for Gymnura japonica is about 30 cm disc length, Rhynchobatus australiae about 130 cm total length, Rhinoptera javanica about 90 cm total length, Hemitrygon sinensis about 35 cm disc length, Pastinachus stellurostris about 65 cm disc length, and Rhina encylostome about 155 cm total length. It could be inferred that most of these species were exploited at the juvenile stage. However, almost all of Aetobatus flagellum, Aetobatus cf. narinari, Dasyatis microps, Neotrygon orientalis, Glaucostegus typus, Rhinobatos punctifer, Rhinobatos cf. formosensis, Maculabatis gerrardi, Brevitrygon heterura, Urogymnus granulatus, Himantura uarnak, Brevitrygon imbricata, Pateobatis uarnacoides and Maculabatis pastinacoides were mature. Most shark species landed were immature except for Carcharhinus macloti, Carcharhinus melanopterus, Chiloscyllium hasseltii, Loxodon macrorhinus and Rhizoprionodon acutus. First maturing size for these species are $70 \mathrm{~cm}, 100 \mathrm{~cm}, 50 \mathrm{~cm}, 60 \mathrm{~cm}$ and 70 cm total length respectively. Size range of all sharks and rays species from July to December 2015 are shown in Table 8A.
Table 8A: Size Range of Sharks (Total Length), Rays (Disc Length) Except for Glaucostegus sp., Glaucostegus typus, Narcine brevilabiata, Narcine lingula, Rhina ancylostoma, Rhinobatos cf. formosensis, Rhinobatos penggali, Rhinobatos punctifer, and Rhynchobatus australiae (Total Length)and Skates (Total Length) from July - December 2015. All Measurements in cm.

In general most ray species sampled from January to June 2016 were mature except for Glycostegus typus, Gymnura poecilura, Pateobatis fai, Maculabatis pastinacoides, Mobula japanica, Pastinachus stellurostris, Rhina encylostoma, Rhinobatos cf. formosensis, Rhinoptera javanica, Rhinoptera jayakari and Taenuirops meyeni. However, almost all of Aetobatus flagellum, Aetobatus cf. narinari, Megatrygon microps, Maculabatis gerrardi, Pateobatis jenkinsii, Himantura leoparda, Pateobatis uarnacoides, Himantura uarnak, Urogymnus granulatus, Brevitrygon heterura, Mobula kuhlii, Neotrygon orientalis, Rhinobatos punctifer were mature. Most shark species landed were immature except for Carcharhinus macloti, Chiloscyllium hasseltii, Hemigaleus microstoma, Mustelus mosis and Scoliodon laticaudus. Size range of all sharks and rays species from January to June 2016 are shown in Table 8B.
Table 8B: Size Range of Sharks (Total Length), Rays (Disc Length) Except for Glaucostegus typus, Rhina ancylostoma, Rhinobatos cf. formosensis, and Rhinobatos punctifer (Total Length)and Skates (Total Length) from January - June 2016. All Measurements in cm.

### 2.1.7 Fishing Effort and CPUE (Catch per Unit Effort)

Total day of operation for all gears was 1,168 days. Operation of trawl nets was the highest with 917 days compared to giant set bag net 147 days and set bag net 104 days. For trawl net, total day of operation in 2015 was 511 days and 406 days in 2016. For giant set bag net, day at operation in 2015 was 78 days and 69 days in 2016. Monthly fishing efforts (days at operation) of the sampled vessels are summarized in Table 9A.

Table 9A: Days at Operation by Gears Sampled during the Study Period

| Type of Gear | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand <br> Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

A total of 4,672 operations by all gears were sampled during the study period. Operation by trawl net was the highest at 3,668 followed by giant set bag net 588 and set bag net 416 operations. In 2015, number of operation for trawl net was 2,044 and 1,624 operations in 2016. For giant set bag net, number of operation in 2015 was 312 and 276 operations in 2016 . The details are shown in
Table 9B.
Table 9B: Numbers of Operation by Gears Sampled during the Study Period

| Total Number of | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

In case of the gear of which annual effort excess 1,000 days of operation or 1,000 number of operations, CPUE for 12 months was estimated by weight and number of individuals by species. Sphyrna lewini was the top with $2.17 \mathrm{~kg} /$ day operation, $0.54 \mathrm{~kg} /$ pperation and $2.81 \mathrm{~kg} / \mathrm{km}^{2}$ followed by Mustelus mosis at $1.59 \mathrm{~kg} /$ day of operation, $0.40 \mathrm{~kg} / \mathrm{number}$ of operation and $2.05 \mathrm{~kg} / \mathrm{km}^{2}$, and Scoliodon laticaudus at $1.53 \mathrm{~kg} / \mathrm{day}$ of operation, $0.38 \mathrm{~kg} /$ number of operation and $1.97 \mathrm{~kg} / \mathrm{km}^{2}$. CPUE for other species are shown in Table 10A.

Table 10A: Top 10 CPUE Sharks Species by Weight Captured by Trawl Net during the Study Period

| Rank | Species | Total <br> Weight <br> (kg) by <br> species | CPUE <br> (kg/Day of <br> Operation) | CPUE <br> (kg/Number of <br> Operation) | CPUE <br> (kg/Swept <br> Area (km²)) |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Sphyrna lewini | $1,991.84$ | 2.17 | 0.54 | 2.81 |
| 2 | Mustelus mosis | $1,453.53$ | 1.59 | 0.40 | 2.05 |
| 3 | Scoliodon laticaudus | $1,399.23$ | 1.53 | 0.38 | 1.97 |
| 4 | Mustelus sp. | 613.72 | 0.67 | 0.17 | 0.86 |
| 5 | Loxodon macrorhinus | 283.70 | 0.31 | 0.08 | 0.40 |
| 6 | Carcharhinus leucas | 211.94 | 0.23 | 0.06 | 0.30 |
| 7 | Rhizoprionodon acutus | 84.98 | 0.09 | 0.02 | 0.12 |
| 8 | Carcharhinus macloti | 81.06 | 0.09 | 0.02 | 0.11 |
| 9 | Galeocerdo cuvier | 77.07 | 0.08 | 0.02 | 0.11 |
| 10 | Chiloscyllium hasseltii | 36.12 | 0.04 | 0.01 | 0.05 |

In term of CPUE by number of individual, Scoliodon laticaudus was the highest with 3.87 tails/day of operation, 0.97 tails/number of operation and 5.00 tails $/ \mathrm{km}^{2}$ followed by Mustelus mosis with 2.57 tails/day of operation, 0.64 tails/number of operation and 3.32 tails $/ \mathrm{km}^{2}$ and Mustelus sp at 2.24 tails/day of operation, 0.56 tails/operation and 2.90 tails $/ \mathrm{km}^{2}$. Details are shown in Table 10B.

Table 10B: Top Nine (9) CPUE Sharks Species by Number of Individual Captured by Trawl Net during the Study Period

| Rank | Species | $\begin{array}{c}\text { Estimated } \\ \text { Number } \\ \text { of } \\ \text { Individual }\end{array}$ | $\begin{array}{c}\text { CPUE } \\ \text { (Number of } \\ \text { individual/Day } \\ \text { of Operation) }\end{array}$ | $\begin{array}{c}\text { CPUE } \\ \text { (Number of } \\ \text { individual/ } \\ \text { Number of } \\ \text { Operation) }\end{array}$ | $\begin{array}{c}\text { CPUE } \\ \text { (Number of } \\ \text { individual/ } \\ \text { Swept Area } \\ \text { (km }\end{array}$ |
| :---: | :--- | ---: | ---: | ---: | ---: |
| )) |  |  |  |  |  |$]$

In term of CPUE by weight for rays, Rhinobatos cf formosensis was the top with $4.26 \mathrm{~kg} / \mathrm{day}$ operation, $1.06 \mathrm{~kg} / \mathrm{number}$ of operation and $5.50 \mathrm{~kg} / \mathrm{km}^{2}$ followed by Brevitrygon heterura at 3.41 $\mathrm{kg} /$ day operation, $0.85 \mathrm{~kg} /$ number of operation and $4.41 \mathrm{~kg} / \mathrm{km}^{2}$, and Rhinobatos punctifer at 3.11 $\mathrm{kg} /$ day operation, $0.78 \mathrm{~kg} /$ number of operation and $4.02 \mathrm{~kg} / \mathrm{km}^{2}$. CPUE for other species by weight are shown in Table 10C.

Table 10C: Top Nine (9) CPUE Rays Species by Weight Captured by Trawl Net during the Study Period

| Rank | Species | Total Weight <br> $\mathbf{( k g )}$ by <br> species | CPUE (kg/ <br> Day of <br> Operation) | CPUE (kg/ <br> Number of <br> Operation) | CPUE (kg/ <br> Swept Area <br> $\left.\left(\mathbf{k m}^{2}\right)\right)$ |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Rhinobatos cf formosensis | $3,906.05$ | 4.26 | 1.06 | 5.50 |
| 2 | Brevitrygon heterura | $3,127.75$ | 3.41 | 0.85 | 4.41 |
| 3 | Rhinobatos punctifer | $2,852.17$ | 3.11 | 0.78 | 4.02 |
| 4 | Urogymnus granulatus | $2,067.16$ | 2.25 | 0.56 | 2.91 |
| 5 | Gymnura japonica | $2,043.13$ | 2.23 | 0.56 | 2.88 |
| 6 | Himantura leoparda | $1,131.97$ | 1.23 | 0.31 | 1.59 |
| 7 | Pateobatis jenkinsii | 971.04 | 1.06 | 0.26 | 1.37 |
| 8 | Rhinoptera javanica | 756.59 | 0.83 | 0.21 | 1.07 |
| 9 | Himantura uarnak | 679.85 | 0.74 | 0.19 | 0.96 |

In term of CPUE for rays by number of individual, Brevitrygon heterura is the highest with 11.53 tails/day of operation, 2.88 tails/number of operation and 14.9 tails $/ \mathrm{km}^{2}$ followed by Rhinobatis cf formosensis with 7.27 tails/day of operation, 1.82 tails/number of operation and 9.4 tails $/ \mathrm{km}^{2}$ and Gymnura japonica at 7.09 tails/day of operation, 1.77 tails/number of operation and 9.15 tails/km². Details are shown in Table 10D.

Table 10D: Top Nine (9) CPUE Rays Species by Number of Individual Captured by Trawl Net during the Study Period

| Rank | Species | Estimated <br> Number of <br> Specimen | CPUE <br> (Number of <br> specimen/Day <br> of Operation) | CPUE <br> (Number of <br> specimen / <br> Number of <br> Operation) | CPUE <br> (Number of <br> specimen/ <br> Swept Area <br> $\left(\mathbf{k m}^{2}\right)$ ) |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Brevitrygon heterura | $10,576.46$ | 11.53 | 2.88 | 14.90 |
| 2 | Rhinobatos cf formosensis | $6,670.94$ | 7.27 | 1.82 | 9.40 |
| 3 | Gymnura japonica | $6,498.91$ | 7.09 | 1.77 | 9.15 |
| 4 | Rhinobatos punctifer | $3,881.08$ | 4.23 | 1.06 | 5.46 |
| 5 | Rhinoptera javanica | 428.35 | 0.47 | 0.12 | 0.60 |
| 6 | Narcine brevilabiata | 371.62 | 0.41 | 0.10 | 0.52 |
| 7 | Narcine lingula | 339.04 | 0.37 | 0.09 | 0.48 |
| 8 | Brevitrygon imbricata | 246.25 | 0.27 | 0.07 | 0.35 |
| 9 | Neotrygon orientalis | 235.28 | 0.26 | 0.06 | 0.33 |

For skate CPUE by weight for Okamejei jensenae was $0.04 \mathrm{~kg} /$ day operation, $0.01 \mathrm{~kg} / \mathrm{number}$ of operation and $0.06 \mathrm{~kg} / \mathrm{km}^{2}$ and for Okamejei sp was $0.02 \mathrm{~kg} /$ day operation, $0.01 \mathrm{~kg} / \mathrm{number}$ of operation and $0.03 \mathrm{~kg} / \mathrm{km}^{2}$ as shown in Table 10E.

Table 10E: CPUE for Skate Species by Weight Captured by Trawl Net during the Study Period

| Species | Total Weight <br> (kg) by Species | CPUE <br> (kg/Day of <br> Operation) | CPUE <br> (kg/Number of <br> Operation) | CPUE <br> $(k g /$ Swept Area <br> $\left.\left.\mathbf{( k m}^{2}\right)\right)$ |
| :--- | ---: | ---: | ---: | ---: |
| Okamejei jensenae | 39.80 | 0.04 | 0.01 | 0.06 |
| Okamejei sp | 21.40 | 0.02 | 0.01 | 0.03 |

Table 10F showed CPUE by number of individual for skate. For Okamejei jensenae CPUE was 0.22 tails/day of operation, 0.06 tails/number of operation and 0.29 tails $/ \mathrm{km}^{2}$, and for Okamejei sp 0.08 tails/day of operation, 0.02 tails/number of operation and 0.1 tails/km².

Table 10F: CPUE for Skate Species by Number of Individual Captured by Trawl Net during
the Study Period

| Species | Estimated <br> Number of <br> Specimen | CPUE <br> (Number of <br> specimen/Day <br> of Operation) | CPUE <br> (Number of <br> specimen/Number <br> of Operation) | CPUE <br> (Number of <br> specimen/Swept <br> Area (km2)) |
| :--- | ---: | ---: | ---: | ---: |
| Okamejei jensenae | 205.17 | 0.22 | 0.06 | 0.29 |
| Okamejei sp | 71.33 | 0.08 | 0.02 | 0.10 |

### 2.1.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally. Local middleman bought at jetties and distributed to local markets around Yangon. The price at landing sites varied according to species. The most expensive rays species were Urogymnus granulatus, Himantura uarnak, Maculabatis pastinacoides and Maculabatis gerrardi and was sold at K8,500-9,000/kg followed by Neotrygon orientalis, Rhynchobatus australiae, Mobula kuhlii at K8,000-k9,000/kg. The cheapest rays were Rhinoptera jayakari, Rhinobatos cf formosensis, Rhinoptera javanica, Dasyatis microp, Mobula japanica were sold at K7,500-8,500/ kg . In general, bigger sized rays were more expensive than smaller ones.

Small sized sharks with total length of less than 23 cm were sold locally at K3,000-5,000/kg. The most expensive sharks Carcharhinus leucas and Carcharhinus sorrah were sold at K9,000/kg, and Sphyrna lewini at K8,000/kg. Market destinations for sharks and rays were similar. Normally the price at wet markets was about 20-50\% higher than at landing site. The price was almost consistent for the whole year for all species but can sometimes fluctuate up to $50 \%$ when supply was limited; especially for Himantura gerarrdi, Rhynchobatus australiae, Carcharhinus sorrah and Carcharhinus leucas. Fins of adult Rhynchobatus australiae and Carcharhinus leucas were sold separately, with the price ranging between $\mathrm{K} 30,000-\mathrm{K} 45,000 / \mathrm{kg}$ and $\mathrm{K} 35,000-\mathrm{K} 55,000 / \mathrm{kg}$ respectively. All sharks and rays were landed whole with fins. The details are shown in Table 11. Small, medium and big size category for each species is as shown in Appendix III.

Table 11: Price of Sharks and Rays by Species from Yangon Landings Site in 2015. (All prices in Kyat per kilogram)

| Species | Range price <br> (Kyats/kg) | Part | Market <br> Destination |
| :--- | :---: | :--- | :--- |
| Sharks |  |  |  |
| Carcharhinus amblyrhynchoides | $3,000-5,000$ | Whole body | Local in Yangon |
| Carcharhinus brevipinna | $5,000-9,000$ | Whole body | Local in Yangon |
| Carcharhinus leucas | $3,000-9,000$ | Whole body | Local in Yangon |
| Carcharhinus melanopterus | $3,000-7,000$ | Whole body | Local in Yangon |
| Carcharhinus macloti | $5,000-5,700$ | Whole body | Local in Yangon |
| Carcharhinus sorrah | $3,000-9,000$ | Whole body | Local in Yangon |
| Carcharhinus limbatus | $5,000-7,000$ | Whole body | Local in Yangon |

### 2.2 Ye Township, Mon State Landing Site

### 2.2.1 Landing Samples

Specimens were collected at two (2) jetties namely Ze Phyu Thaung and Asin during the study period. The highest by month was six (6) in December 2015 and May 2016 followed by five (5) in other months. The highest by gear type was 45 of gillnet followed by 10 of longline, four (4) of set bag net and three (3) of stow net. The details are shown in Table 12.

### 2.2.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks and rays was gillnet at 758.5 kg comprising 312.0 kg rays and 446.5 kg sharks. While set bag nets contributed 180.7 kg of rays and 112.0 kg of sharks. Longline contributed 155.0 kg of rays and 9.9 kg of shark, and stow net contributed 3.3 kg of rays. Most gillnet operated between 10 nautical miles from the coastline in Mon State fishing ground. The highest landing of rays by month was from gillnets at 68.3 kg in September 2015, and the highest landing of sharks by month was from gillnets in July 2015 at 122.6 kg respectively. The details are shown in Table 13.

### 2.2.3 Sharks and Rays Composition

Total of $42,331.1 \mathrm{~kg}$ of fish was landed from 62 landings during the study period. Rays and sharks made up 651.0 kg and 568.4 kg or $1.5 \%$ and $1.3 \%$ from the total landing respectively. Landings of bony fish and others was $41,111.8 \mathrm{~kg}$ or $97.1 \%$. Average landings per month for rays and sharks were 54.2 kg and 47.4 kg respectively. The highest landing by month for rays was 142.5 kg in August 2015, followed by 111.3 kg in February 2016 and 82.2 kg in October 2015. The highest landing for sharks was 133.9 kg also in August followed by 122.6 kg in July 2015 and 57.3 kg in June 2016. In general, the landing of rays and sharks ranged between 0.2-6.0\% and 0.1-10.6\% respectively from total landing. The details are shown in Table 14.

Table 14: Catch Composition of Sharks, Rays, and Bony Fishes and Others by Month from Three (3) Landing Sites at Ye Township. All Weights in Kilogram.

| Year | Month | Sharks (kg) | $\%$ <br> Sharks | All Rays (kg) | \% <br> Rays | Bony fishes and others (kg) | \% Bony <br> fishes <br> and <br> others | Total Catch (kg) |

|  | June | 57.3 | 1.8 | 31.1 | 1.0 | 3,138.0 | 97.3 | 3,226.3 |
| Grand Total |  | 568.4 |  | 651.0 |  | 41,111.8 |  | 42,331.1 |
| Average |  | 47.4 | 1.3 | 54.2 | 1.5 | 3,426.0 | 97.1 | 3,527.6 |

### 2.2.4 Sample Size

A total of 350 tails belonging to 165 rays and 185 sharks were sampled comprising 14 species of rays and six species of sharks. The most abundant ray species were Pateobatis uarnacoides and Maculabatis pastinacoides followed by Brevitrygon heterura. The highest number of rays sampled by month was 53 in May followed by 15 in June 2016 and 11 in September 2015 and January 2016. The most abundant shark species were Scoliodon laticaudus followed by Carcharhinus leucas and Sphyrna lewini. The highest number of sharks sampled by month was 51 in August 2016, followed by 24 in July 2015 and 20 in October, Novenmer 2015 and June 2016. The most common ray species were Pateobatis uarnacoides and Maculabatis pastinacoides. These species recorded in seven (7) months during the study period. The most common shark species were Scoliodon laticaudus and Carcharhinus leucas. These species were landed also in seven (7) months during the study period. Other species were rarely landed and only landed between 1-4 months during the study period. The details are as shown in Table 15.

Table 15: Sample Size of Sharks and Rays by Species

| Species | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand Total |

### 2.2.5 Weight of Sharks and Rays by Species

A total of $1,219.4 \mathrm{~kg}$ was landed from 62 landings comprising 651.0 kg rays, and 568.4 kg sharks. For rays, the highest landing by weight was from species Pateobatis uarnacoides amounting to 291.9 kg , followed by 96.4 kg for Rhinoptera jayakari and 76.4 kg for Maculabatis pastinacoides. The highest landing by month for Pateobatis uarnacoides was 128.7 kg in August and for Rhinoptera jayakari was 62.9 kg in September 2015. Weight of other species ranged between $1-62 \mathrm{~kg}$. The highest landing of shark species was 274.2 kg for Scoliodon laticaudus followed by Carcharhinus leucas 146.8 kg , Carcharhinus sorrah 77.2 kg and Sphyrna lewini 33.8 kg . The highest landing by month for Scoliodon laticaudus was 124.5 kg in August, 39.6 kg in September for Carcharhinus leucas, 72.7 kg for Carcharhinus sorrah in July 2015, and for Sphyrna lewini was 32.0 kg in June 2016. Weight of other species ranged between $17-19 \mathrm{~kg}$. The details are shown in Table16.
Table 16: Weight of Sharks and Rays (in kg) by Species

| Species | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand Total |

### 2.2.6 Size Range of Sharks and Rays

In general most ray species sampled from July to December 2015 were immature except for some specimens of Pateobatis uarnacoides caught in August and October 2015. For sharks almost all specimens were immature except for Scoliodon laticaudus. Almost all of this species was mature. The range average size of all sharks and rays were considered as juvenile and sub-adult. Size range of all sharks and rays species from July to December 2016 are shown in Table 17A. During January - June 2016, most specimens of Glycostegus typus, Himantura uarnak, Brevitrygon heterura, Rhinoptera jayakari, Narcine brunnea and all Scoliodon laticaudus were mature. Other specimens mostly juvenile or sub-adult. Size range of all sharks and rays species from January to June 2016 are shown in Table 17B.

### 2.2.7 Fishing Effort and CPUE (Catch per Unit Effort)

Total day of operation for all gears was 628 days. Operation of gillnets was the highest with 540 days compared to longline ( 45 days), set bag net ( 40 days) and stow net only three days. For gillnets, total day of operation in 2015 was 192 days and 288 days in 2016. For longline day at operation in 2015 was 42 days and only three days in 2016. Monthly fishing efforts (days at operation) of the sampled vessels are summarized in Table 18A.

Table 18A: Days at Operation by Gears Sampled during the Study Period

| Days of <br> Operation | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand <br> Total |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Gear | Jul | Aug | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun |  |
| Gillnet | 36 | 12 | 60 | 36 | 60 | 48 | 36 | 48 | 60 | 48 | 48 | 48 | 540 |
| Longline | 10 | 5 |  | 10 |  | 17 | 2 |  |  | 1 |  |  | 45 |
| Set Bag Net |  | 30 |  |  |  |  |  | 10 |  |  |  |  | 40 |
| Stow Net |  |  |  |  |  |  |  |  |  |  | 2 | 1 | 3 |
| Grand Total | $\mathbf{4 6}$ | $\mathbf{4 7}$ | $\mathbf{6 0}$ | $\mathbf{4 6}$ | $\mathbf{6 0}$ | $\mathbf{6 5}$ | $\mathbf{3 8}$ | $\mathbf{5 8}$ | $\mathbf{6 0}$ | $\mathbf{4 9}$ | $\mathbf{5 0}$ | $\mathbf{4 9}$ | $\mathbf{6 2 8}$ |

A total of 1,417 operations by all gears were sampled during the study period. Operation by gillnet was the highest at 1,080 followed by longline (171), set bag net (160) and stow net six (6) operations. In 2015, number of operation for gillnet was 504 and 576 operations in 2016. For longline, number of operation in 2015 was 168 but in 2016 only three (3) operations. The details are shown in Table 18B.

Table 18B: Number of Operation by Gears Sampled during the Study Period

| Total Number of | 2015 |  |  |  |  |  | 2016 |  |  |  |  |  | Grand Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Gear | Jul | Aug | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun |  |
| Gillnet | 72 | 24 | 120 | 72 | 120 | 96 | 72 | 96 | 120 | 96 | 96 | 96 | 1,080 |
| Longline | 40 | 20 |  | 40 |  | 68 | 2 |  |  | 1 |  |  | 171 |
| Set Bag Net |  | 120 |  |  |  |  |  | 40 |  |  |  |  | 160 |
| Stow Net |  |  |  |  |  |  |  |  |  |  | 4 | 2 | 6 |

In case of the gear of which annual effort excess 1,000 days of operation or 1,000 number of operations, CPUE for 12 months was estimated by weight and number of individuals by species. Scoliodon laticaudus was the top with $0.31 \mathrm{~kg} /$ day of operation, $0.15 \mathrm{~kg} /$ number of operation and $0.04 \mathrm{~kg} / \mathrm{km}$ followed by Carcharhinus leucas at $0.26 \mathrm{~kg} / \mathrm{day}$ of operation, $0.13 \mathrm{~kg} / \mathrm{number}$ of operation and $0.03 \mathrm{~kg} / \mathrm{km}$, and Carcharhinus sorrah at $0.14 \mathrm{~kg} /$ day of operation, $0.07 \mathrm{~kg} / \mathrm{number}$ of operation and $0.02 \mathrm{~kg} / \mathrm{km}$. CPUE for other species are shown in Table 19A.

Table 19A: Top Six (6) CPUE Sharks Species by Weight Captured by Gillnet during the Study Period

| Rank | Species | Total <br> Weight <br> (kg) by <br> Species | CPUE (Kg/ <br> Day of <br> Operation) | CPUE (Kg/ <br> Number of <br> Operation) | CPUE <br> $(\mathrm{kg} /$ Total <br> Length of <br> Net (Km)) |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Scoliodon laticaudus | 165.69 | 0.31 | 0.15 | 0.04 |
| 2 | Carcharhinus leucas | 142.78 | 0.26 | 0.13 | 0.03 |
| 3 | Carcharhinus sorrah | 77.24 | 0.14 | 0.07 | 0.02 |
| 4 | Sphyrna lewini | 33.83 | 0.06 | 0.03 | 0.01 |
| 5 | Carcharhinus brevipinna | 15.26 | 0.03 | 0.01 | 0.00 |
| 6 | Carcharhinus amblyrhynchoides | 11.71 | 0.02 | 0.01 | 0.00 |

In term of CPUE by number of individual, Scoliodon laticaudus was the highest with 1.02 tails/day of operation, 0.51 tail/number of operation and 0.13 tail/km followed by Sphyrna lewini with 0.15 tail/day of operation, 0.08 tail/number of operation and 0.02 tail/km, and Carcharhinus sorrah at 0.09 tail/day of operation, 0.04 tail/number of operation and 0.01 tail/km. Details are shown in Table 19B.

Table19B: Top Six (6) CPUE Sharks Species by Number of Individual Captured by Gillnet during the Study Period

| Rank | Species | Estimated <br> Number <br> of <br> Individual | CPUE <br> (Number <br> of <br> Individual <br> /Days of <br> Operation) | CPUE <br> (Number of <br> Individual <br> INumbers <br> of <br> Operation) | CPUE <br> (Number <br> of <br> Individual <br> ITotal <br> Length of <br> Net (km)) <br> 1 Scoliodon laticaudus |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 2 | Sphyrna lewini | 549.90 | 1.02 | 0.51 | 0.13 |
| 3 | Carcharhinus sorrah | 43.31 | 0.15 | 0.08 | 0.02 |
| 4 | Carcharhinus leucas | 33.29 | 0.09 | 0.04 | 0.01 |
| 5 | Carcharhinus amblyrhynchoides | 4.57 | 0.06 | 0.03 | 0.01 |
| 6 | Carcharhinus brevipinna | 3.78 | 0.01 | 0.00 | 0.00 |

Rhinoptera jayakari was the top with $0.18 \mathrm{~kg} /$ day of operation, $0.09 \mathrm{~kg} / \mathrm{number}$ of operation and $0.02 \mathrm{~kg} / \mathrm{km}$ followed by Pateobatis uarnacoides at $0.12 \mathrm{~kg} /$ day of operation, $0.06 \mathrm{~kg} / \mathrm{number}$ of operation and $0.02 \mathrm{~kg} / \mathrm{km}$, and Himantura uarnak at $0.10 \mathrm{~kg} / \mathrm{day}$ of operation, $0.05 \mathrm{~kg} / \mathrm{number}$ of operation and $0.01 \mathrm{~kg} / \mathrm{km}$. CPUE for other species are shown in Table 19 C.

Table 19C: Top 10 CPUE Rays Species by Weight Captured by Gillnet during the Study Period

| Rank | Species | Total Weight <br> $\mathbf{( k g )}$ by <br> Species | CPUE (Kg/ <br> Day of <br> Operation) | CPUE (Kg/ <br> Number of <br> Operation) | CPUE (kg/ <br> Total Length <br> of Net (km)) |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Rhinoptera jayakari | 96.43 | 0.18 | 0.09 | 0.02 |
| 2 | Pateobatis uarnacoides | 64.30 | 0.12 | 0.06 | 0.02 |
| 3 | Himantura uarnak | 53.30 | 0.10 | 0.05 | 0.01 |
| 4 | Maculabatis pastinacoides | 51.22 | 0.09 | 0.05 | 0.01 |
| 5 | Brevitrygon heterura | 33.04 | 0.06 | 0.03 | 0.01 |
| 6 | Glaucostegus typus | 3.85 | 0.01 | 0.00 | 0.00 |
| 7 | Urogymnus granulatus | 3.52 | 0.01 | 0.00 | 0.00 |
| 8 | Rhinoptera adspersa | 3.20 | 0.01 | 0.00 | 0.00 |
| 9 | Rhinoptera javanica | 1.50 | 0.00 | 0.00 | 0.00 |
| 10 | Gymnura japonica | 1.32 | 0.00 | 0.00 | 0.00 |

In term of CPUE by number of individual, Brevitrygon heterura was the highest with 0.16 tail/day of operation, 0.08 tail/number of operation and 0.02 tail/km followed by Rhinoptera jayakari with 0.04 tail/day of operation, 0.02 tail/number of operation and less than 0.00 tail/km and Maculabatis pastinacoides at 0.03 tail/day of operation, 0.01 tail/number of operation and less than 0.00 tail/km. Details are shown in Table 19D.

Table 19D: Top 10 CPUE Rays Species by Number of Individual Captured by Gillnet during the Study Period

| Rank | Species | Estimated <br> Number <br> of <br> Individual | CPUE <br> (Number of <br> Individual / <br> Days of <br> Operation) | CPUE <br> (Number of <br> Individual / <br> Numbers of <br> Operation) | CPUE <br> (Number of <br> Individual <br> ITotal <br> Length of <br> Net (km) |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 1 | Brevitrygon heterura | 85.59 | 0.16 | 0.08 | 0.02 |
| 2 | Rhinoptera jayakari | 19.78 | 0.04 | 0.02 | 0.00 |
| 3 | Maculabatis pastinacoides | 14.21 | 0.03 | 0.01 | 0.00 |
| 4 | Pateobatis uarnacoides | 5.32 | 0.01 | 0.00 | 0.00 |
| 5 | Glaucostegus typus | 2.00 | 0.00 | 0.00 | 0.00 |

| 7 | Gymnura japonica | 1.00 | 0.00 | 0.00 | 0.00 |
| 8 | Himantura uarnak | 1.00 | 0.00 | 0.00 | 0.00 |
| 9 | Urogymnus granulatus | 1.00 | 0.00 | 0.00 | 0.00 |
| 10 | Rhinoptera adspersa | 1.00 | 0.00 | 0.00 | 0.00 |

### 2.2.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally. The major markets were wholesale market in Ye Market and other market in Mawlamyine. The price varied according to species. The most expensive rays species were Urogymnus granulatus, Maculabatis gerrardi, Himantura uarnak and Gymnura japonica sold at K2,000-10,000/kg followed by Glaucostegus typus at K2,000-10,000/Viss. The cheapest rays were Rhinoptera jayakari, Rhinoptera adspersa, Brevitrygon heterura sold at K2,000-4,000/Viss and Narcine brunnea sold at K1,000/Viss. In general, bigger sized rays were more high-priced than smaller ones.

Small sized sharks with total length of less than 23 cm were sold locally at K3,000-4,000/Viss. The most expensive sharks were Carcharhinus leucas, Carcharhinus sorrah and Sphyrna lewini sold at K8,000/Viss. Market destinations for sharks and rays were similar. Market where they are mainly used for consume during traditional water festival. Normally the price at wet markets was about $20-50 \%$ higher than at landing site. The price was almost consistent for the whole year for all species but can occasionally fluctuate up to $50 \%$ when supply was limited; especially for Himantura gerarrdi, Carcharhinus sorrah and Carcharhinus leucas. Some species such as Scoliodon laticaudus were sold to buyers in Ye Market and Mawlamyine. Fins of adult Carcharhinus leucas were sold separately, with the price ranging between K30,000-55,000/Viss. All sharks and rays were landed whole with fins. The details are shown in Table 20. Small, medium and big size category for each species is as shown in Appendix III.

Table 20: Price of Sharks and Rays by Species and Market Destination at Ye Township. Note: 1 Viss=1.5 kg

| Species | Range Price <br> (Kyats/Viss) | Part | Market Destination |
| :--- | :---: | :---: | :---: |
| Sharks |  |  |  |
| Scoliodon laticaudus | $2,000-3,000$ | Whole body | Local in Ye |
| Carcharhinus sorrah | $4,000-8,000$ | Whole body | Local in Ye |
| Carcharhinus brevipinna | $4,000-8,000$ | Whole body | Local in Ye |
| Carcharhinus amblyrhynchoides | $4,000-8,000$ | Whole body | Local in Ye |
| Carcharhinus leucas | $4,000-8,000$ | Whole body | Local in Ye |
| Sphyrna lewini | $2,000-8,000$ | Whole body | Local in Ye |
| Rays | $2,000-10,000$ |  |  |
| Pateobatis uarnacoides | $2,000-10,000$ | Whole body | Local in Ye |
| Maculabatis gerrardi | $2,000-10,000$ | Whole body | Local in Ye |
| Urogymnus granulatus | $2,000-10,000$ | Whole body | Local in Ye |
| Himantura uarnak | $1,000-3,000$ | Whole body | Local in Ye |
| Brevitrygon heterura | $2,000-10,000$ | Whole body | Local in Ye |
| Himantura sp. | $2,000-10,000$ | Whole body | Local in Ye |
| Pastinachus gracilicaudus | $2,000-10,000$ | Whole body | Local in Ye |
| Maculabatis pastinacoides | $2,000-4,000$ | Whole body | Local in Ye |
| Rhinoptera jayakari | $2,000-4,000$ | Whole body | Local in Ye |
| Rhinoptera javanica |  |  |  |

| Species | Range Price <br> (Kyats/Viss) | Part | Market Destination |
| :--- | :---: | :---: | :---: |
| Rhinoptera adspersa | $2,000-4,000$ | Whole body | Local in Ye |
| Glaucostegus typus | $2,000-10,000$ | Whole body | Local in Ye |
| Gymnura japonica | $2,000-10,000$ | Whole body | Local in Ye |
| Narcine brunnea | $1,000-3,000$ | Whole body | Local in Ye |

### 3.0 OUTPUT AND OUTCOME

The project outputs and outcomes are summarised in Table 21 as shown below.
Table 21: Outputs and Outcomes

| No. | Output | Outcome |
| :---: | :--- | :--- |
| 1. | Three (3) trained personnel in sharks and <br> rays taxonomy from the Department of <br> Fisheries Myanmar. | Trained staffs are now able to make the <br> right and valid identification of species. <br> Training materials stored electronically and <br> easy to overload. |
| 2. | A standardised format for data collection for <br> national activity produced. | Improved technique of data collection for <br> implementation at national level. |
| 3. | Detailed information on the percentages of <br> sharks and rays from the total landing at <br> pilot project sites. | Confirmed previous data published in <br> Myanmar National Statistics. Sharks and <br> rays were not targeted and contributed to <br> only about 2.2\% of total marine landing. |
| 4. | Information on relative dominance of <br> the different species of sharks and rays <br> obtained. | Increased awareness of needs and <br> measures for shark conservation and <br> management on specific species. |
| 5. | Information on the monthly fluctuation of <br> the different species of sharks and rays <br> obtained. | Trends of landings by species analysed for <br> national level management. |
| 6. | Stage of maturity for the different species of <br> sharks and rays determined. | Enlarged awareness of needs and <br> measures for shark conservation and <br> management among stakeholders. |
| 7. | Information on usage and marketing of the <br> landed sharks and rays were obtained from <br> the pilot project. | All rays and sharks are landed whole, fully <br> used with no finning activities on fishing <br> vessels. |
| 8. | A report on landing of sharks and rays up to <br> species level from two sites in Myanmar. | Data recording on sharks and rays will <br> be better from generic terms 'sharks' and <br> 'rays' to species level. |
| 9. | Issues and problems arising from this <br> activity identified and improvements made <br> especially with the data collection format. | Enhance of a comprehensive national <br> data collection system for sharks and rays <br> as part of the National Plan of Action for <br> Sharks. |

### 4.0 FUTURE ACTIVITIES

Myanmar will continue to record landing data up to species level at an additional two (2) sites including Yangon and Mawlamyine in all Myanmar coastal regions in 2017 pending fund from SEAFDEC. Department of Fisheries, Myanmar would like to collect the reliable data and information in all coastal areas. Data collection at the current two (2) landing sites is to be continued if budget avaiable. Awareness programme will be continued in other parts of the country. All activities are shown in Appendix III.

### 5.0 CONCLUSION

During this project four (4) officers from Department of Fisheries Myanmar were trained in taxonomy and in data collection using the new harmonized format. There are from Ye Township and Yangon Region. Three (3) landing sites of Yangon, namely Annawar Aung, Shwe Zinyaw Hein and Annawar Holding Fisheries were selected as the study sites as they were the main landing sites of sharks and rays in the country. A total of 18 species of sharks from two (2) Orders and five (5) Families, and 38 spesies of rays from three (3) Orders and 10 Families, two (2) species of skates from one (1) Order and one (1) Family were recorded in Yangon. Study at Ye Township recorded six (6) species of sharks from one (1) Order and two (2) Families and 14 spesies of rays from three (3) Orders and five (5) Families. Details are shown in Appendix I. In term of percentage of total marine landings, sharks, rays and skates only contributed $0.2 \%, 1.1 \%$ and $0.002 \%$ at Yangon, and $1.3 \%$ for sharks and $1.6 \%$ for rays at Ye Township respectivley. These figures confirmed earlier data that sharks and rays were only by-catch and not targeted and contributed to about $2 \%$ of the total marine landing. The most abundant shark species at Yangon were, Sphyrna lewini and Scoliodon laticaudus and for rays, Brevitrygon heterura, Rhinobatos puntifer. The most common shark species were Scoliodon laticaudus and Chiloscyllium hasseltii, Mustilus sp. The most abundant shark species at Mawlamyine were Carcharhinus leucas and Scoliodon laticaudus while for rays Maculabatis pastinacoides and Pateobatis uarnacoides. The most common shark species were Carcharhinus brevipinna and Scoliodon laticaudus while for rays Brevitrygon heterura.

All big sized sharks of more than 1.5 meters in total length such as Carcharhinus leucas, Carcharhinus sorrah, Galeocerdo cuvier, Sphyrna lewini, and medium sized sharks such as Rhizoprionodon acutus, Carcharhinus melanopterus were rarely caught due to nature of fishing area and gear used. All rays and sharks were landed whole, fully used with no finning activities on fishing vessels. Base on latest checklist a total of 59 species of sharks from six (6) Order and 15 Families, and 85 species of rays from four (4) Order and 14 Families, and two (2) species of skates from one (1) Order and one (1) Family found in Myanmar waters including freshwater ecosystem.

### 1.0 INTRODUCTION

The marine fishery production of Thailand was harvested from the Gulf of Thailand and the Andaman Sea. Most of the production ( $90 \%$ ) was caught by commercial fishing gears and the rest was caught by small scale fishing gears. Trawl fishery landed about $70 \%$ of the total production in Thai Waters. But, there is no shark's fishery in Thailand. Sharks and rays are caught by a number of fishing gears such as trawls, purse seines, long lines, gill nets and others, especially by the otter-board trawl. Generally, sharks and rays are not the target species but caught as by-catch or incidental catch by marine capture fisheries. There are no specific types of fishing gears to catch only for sharks and rays. Sharks and rays in the total catch were less than $0.5 \%$ of total marine fishery production. Moreover, shark and ray productions are fully utilised in Thailand. Species diversity of sharks and rays in Thai Waters and adjacent areas recorded 135 species comprising 64 sharks and 71 rays (including 1 skate), belonging to 19 families of sharks and 11 families of rays (Krajangdara, 2014).

The cartilaginous fishes or chondrichthyans in Thai Waters and adjacent areas are currently revised and updated in 2016 for supporting database system of NPOA-Sharks, Thailand. The new checklist of cartilaginous fishes was included the record of 162 species, composed of 76 sharks, 79 rays, 5 skates, and 2 chimaeras. These belong to 21 families of sharks, 14 rays, 2 skates, and 1 chimaeras. The high diversity of sharks was recorded from the Orders Carcharhiniformes, Orectolobiformes, Lamniformes and Squaliformes with 49, 10, 7 and 5 species, respectively. (In this checklist, Family Echinorhinidae is in Order Squaliformes. But Ebert et al. (2015) and Weigmann (2016) classified this family to new order, Echinorhiniformes). However, low diversity was record for the Orders Hexanchiformes and Squatiniformes with 2 species in each order. Species diversity in the Order Heterodontiformes was scanty and found only 1 species. As for batoids, high diversity was recorded for the Order Myliobatiformes with 54 species followed by Rhinobatiformes and Torpediniformes with 14 and 8 species, respectively. Only 5 species were recorded from the Order Rajiformes and 3 species from Pristiformes. Even though the stock status of chondrichthyans species in Thailand is still insuficient. With the new record of chondrichthyans species continuously discovered and expected to increase in the future. At present the deep water species are mostly unknown due to limited research activity. Most sharks and rays species landed in Thailand are mainly from the Families Carcharhinidae and Dasyatidae, however, it was very difficult to identify up to species level by untrained and inexperienced enumerators. Only well-trained staff will be better able to make the right and valid identification of species.

### 1.1 Objective

The objectives of this project were:

- to enhance human resource development in elasmobranch taxonomy, and
- to improve landing data recording from generic 'sharks' and 'rays' to species level.

### 1.2 Data Collection at Landing Sites

### 1.2.1 Selection of Study Sites

The Southern Thailand is a major landing site for sharks and rays. The selected sampling sites in the Gulf of Thailand was Songkhla province (comprising 6 districts in namely Ranot, Sathing Phra, Singhanakhon, Muang Songkhla, Chana and Thepa) and in the Andaman Sea was Ranong province (comprising 3 districts in namely Muang Ranong, Kapoe and Suk Samran). Although, there were many type of fishing boats landed in sampling sites such as paired trawler, otter-board trawler, purse seiner, gillnetter and longliner, but the 1-year data collection on sharks and rays in Thailand were only recorded from paired trawler and otter-board trawler which are the main fishing gears for catching sharks and rays. The landing data were collected at 2 fishing ports of fish marketing organization of Songkhla and Ranong where located in Muang district of both sites. The location of landing sites are shown in Figure 1.

Figure 1: Location of Study Sites in the Southern Thailand

### 1.2.2 Fishery Structure and Background of Study Sites

Songkhla Fish Marketing Organization or Songkhla Fishing Port is one of the major landing sites for sharks and rays in the east coast of Southern Thailand. The major gears were trawl nets (260) comprising 247 otter-board trawls and 13 paired trawls. All trawlers are normally operated by 4-6 crew members. All catches were landed from 0500-1100hr by trawlers operating more than 3 nautical miles from the coastline. Fishing operations normally were operated between 4 to 30 days per trip. While Ranong Fish Marketing Organization or Ranong Fishing Port is one of the major landing sites for sharks and rays in the northern of west coast, Thailand. The major gears were trawl nets (243) comprising 211 otter-board trawls and 32 paired trawls. All trawlers are normally operated by $6-13$ crew members. All catches were landed from 0000-0600hr by trawlers operating more than 3 nautical miles from the coastline. Fishing operation normally between 20-25 day per trip, both day and night time. The catches were sold between 0600-1000hr, almost by auction method. The details of trawlers registered of both province are shown in Table 1.

Table 1: Number of Licensed Trawlers at Songkhla and Ranong Province

| Type of Gear | Fishing operation (from coastline) | No. of Vessels in Songkhla | No. of Vessels in Ranong |
| :---: | :---: | :---: | :---: |
| Otter-board trawl | $>3 \mathrm{NM}$ |  |  |
| 10-19.9 GRT | $>3 \mathrm{NM}$ | 56 | 1 |
| 20-59.9 GRT | $>3 \mathrm{NM}$ | 146 | 94 |
| 60-150 GRT | $>3 \mathrm{NM}$ | 45 | 116 |
| Total |  | 247 | 211 |
| Paired trawl |  |  |  |
| 20-59.9 GRT | $>3 \mathrm{NM}$ | 8 | 7 |
| 60-150 GRT | $>3 \mathrm{NM}$ | 5 | 25 |
| Total |  | 13 | 32 |
| Grand Total |  | 260 | 243 |

### 1.3 Appointment of Enumerators

Three Fishery Biologists and one fisheries officer from Department of Fisheries were appointed as enumerators. Their names and addresses are as follows:
i. Mr. Montri SUMONTHA

Fishery Biologist, Professional Level
Ranong Marine Fisheries Station
157 Paknam Subdistrict, Muang District, Ranong, THAILAND 85000
Telephone: +66870241486
Email: montri.sumontha@gmail.com
ii. Ms. Suwantana TOSSAPORNPITAKKUL

Fishery Biologist, Professional Level
Southern Marine Fisheries Research and Development Center (Songkhla)
79/1 Wichianchom Rd., Muang District, Songkhla, THAILAND 90000
Telephone: +66896551817
Email: tsuwantana@yahoo.com
iii. Mr. Watchira SODOP

Fishery Biologist
Ranong Marine Fisheries Station
157 Paknam Subdistrict, Muang District, Ranong, THAILAND 85000
Telephone: +66621613900
Email: wach623@gmail.com
iv. Ms. Jureerat SONGNUI

Fishery Officer, Professional Level
Southern Marine Fisheries Research and Development Center (Songkhla)
79/1 Wichianchom Rd., Muang District, Songkhla, THAILAND 90000
Telephone: +66890178485
Email: juju_songnui@yahoo.com

### 1.4 Materials and Methods

### 1.4.1 Sampling Methods

The sampling activity started in August, 2015 until August, 2016. But no landing sharks and rays at Ranong fishing port in August, 2015. Therefore 12-month data collection at Songkhla conducted from August, 2015 to July, 2016 and Ranong conducted from September, 2015 to August, 2016. All enumerators were requested to record landing data and other related information in a standard form at least 5 days/month. A standard SOP entitled "Standard Operating Procedures Sharks, Rays and Skates Data Collection in the Southeast Asian Waters" was used as a guide. The content included Standard Operation Procedure and instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of enumerator, name of landing site, date of sampling, vessel registration number, vessel GRT, fishing area, price at landing sites, name of species (common name and scientific name), total catch of sharks, rays, commercial and low-value species from each sampling vessel. The completed data in excel sheet were submitted to the respective National Coordinator before submitted to SEAFDEC/MFRDMD before second week of the following month for verification. The data were analysed at the end of each quarter.

### 1.4.2 Selection of Fishing Vessels and Sampling Activities

Between 1-3 fishing vessels were selected for sampling each day for 5 days per month at each landing site. Measurement of Total length (TL) were taken for all sharks species, skates and rays from the Families Rhinidae, Rhynchobatidae, Rhinobatidae, Narcinidae and Narkidae. While Disc Length (DL) were taken for all ray species where the tail is frequently absent or damaged (mainly from the Families Dasyatidae, Gymnuridae, Myliobatidae and Mobulidae). All sharks and rays specimens were measured and weighed individually if the total number was less than 50 tails per vessel. If the total number was more than 50 tails, only $10-50 \%$ were measured. The maturity stage for each individual was estimated according to Compagno et al. (2005), Ahmad and Lim (2012), Ahmad et al. (2014) and Ebert et al. (2015). The total catch of all sharks and rays by species as well as the total catch of commercial and low-value species were also recorded for each sampling vessel. Some samples were brought back to the Southern Marine Fisheries Research and Development Center (Songkhla) and Ranong Marine Fisheries Station then preserved for future reference. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3 Classification

The classification (scientific names) used in this report follows that of Compagno (1998), Compagno and Last (1999), de Carvalho et al. (1999), Compagno et al. (2005), Ahmad and Lim (2012), Ahmad et al. (2014), Ebert et al. (2015), Last et al. (2016) and Weigmann (2016).

### 2.0 RESULTS

### 2.1 Songkhla

### 2.1.1 Landing Samples

A total of 115 trawlers were sampled during the study period. The highest by month was 15 in June, followed by 13 in January. The highest by gear type was 114 of Otter-board trawls. The details are shown in Table 2.

Table 2: Number of Landings Sampled during the Study at Songkhla Fishing Port

| Type of <br> Gear | 2015 |  |  |  |  | 2016 |  |  |  |  |  | Total |  |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |

| Total | 7 | 11 | 11 | 11 | 7 | 13 | 11 | 7 | 8 | 5 | 15 | 9 | 115 |

### 2.1.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks and rays was the otter-board trawl at $8,017 \mathrm{~kg}$ ( $98.1 \%$ ) comprising $4,141 \mathrm{~kg}$ of rays and $3,876 \mathrm{~kg}$ of sharks. While paired trawl contributed $10 \mathrm{~kg}(0.1 \%)$ of rays and $144 \mathrm{~kg}(1.8 \%)$ of sharks. All trawlers operated more than 3 nautical miles from the coastline. The highest landing of rays by month was from otter-board trawl at 671 kg in February, followed by 628 kg in June. While the highest landing of sharks by month from otter-board trawl in July at 773 kg and 502 kg in April. The details are shown in Table 3.
Table 3: Weight of Sharks and Rays (in kg) Caught by Trawls at Songkhla Fishing Port

### 2.1.3 Sharks and Rays Composition

A total of $1,075,826 \mathrm{~kg}$ of catches was landed from 115 trawlers during the study period. Rays and sharks made up $4,151 \mathrm{~kg}$ and $4,020 \mathrm{~kg}(0.4 \%$ and $0.4 \%)$ from the total landing, respectively. Total landings of bony fish was $1,067,655 \mathrm{~kg}$ or $99.2 \%$. Average landings per month for sharks and rays were 335 and 346 kg , respectively. The highest landing by month for rays was 671 kg in February, followed by 628 kg in June and 448 kg in December. However, the highest landing for sharks was 773 kg in July, followed by 502 kg in April and 473 kg in January. In general, the landing of sharks and rays ranged between $0.2-0.8 \%$ and $0.1-0.7 \%$, respectively from total landing. The details are shown in Table 4.

Table 4: Catch Composition of Sharks, Rays and Bony Fishes by Month from 115 Trawler Landings at Songkhla Fishing Port. All Weights in Kilogram.

| Year | Month | Weight <br> of Rays | \% <br> Rays | Weight of <br> Sharks | \% <br> Sharks | Weight <br> of Bony <br> Fishes | \% <br> Bony <br> Fishes | Total Catch |

### 2.1.4 Number of Sample

A total of 8,590 tails belonging to 5,612 rays and 2,978 sharks were sampled comprising 7 species of rays and 9 species of sharks. The most abundant ray species by number were Telatrygon biasa followed by Brevitrygon heterura and Hemitrygon akajei. The highest number of rays sampled by month was 858 in February, followed by 703 in November and 675 in June. The most abundant shark species were Chiloscyllium punctatum followed by Atelomycterus marmoratus and Carcharhinus sorrah. However, the highest number of sharks sampled by month was 468 in January, followed by 396 in April and 296 in July. The most common ray species were Telatrygon biasa followed by Brevitrygon heterura. The most common shark species were Chiloscyllium punctatum and Atelomycterus marmoratus. All these species were landed throughout the year. Other species such as Aetobatus ocellatus, Maculabatis gerrardi, Carcharhinus amblyrhynchos, C. melanopterus, C. sorrah, Chiloscyllium hasseltii, C. plagiosum, and Hemigaleus microstoma, were rarely landed and only landed between 1-3 months during the study period. The details are as shown in Table 5.
Table 5: Number of Sample of Sharks and Rays by Species at Songkhla Fishing Port

| Species | 2015 |  |  |  |  | 2016 |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Aug | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul |  |

| Total Sharks | 232 | 176 | 281 | 182 | 121 | 468 | 262 | 130 | 396 | 162 | 272 | 296 | 2,978 |
| Grand Total | 361 | 566 | 703 | 885 | 643 | 1,067 | 1,120 | 417 | 691 | 370 | 947 | 820 | 8,590 |

### 2.1.5 Weight of Sharks and Rays by Species

A total of $8,171 \mathrm{~kg}$ was landed from 115 trawler landings comprising $4,151 \mathrm{~kg}$ rays and $4,020 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was from Telatrygon biasa amounting to 3,157 kg , followed by 668 kg Brevitrygon heterura and 207 kg Hemitrygon akajei. The highest landing by month was 550 kg for Telatrygon biasa in June, followed by 473 kg in February and 379 kg in July. For Brevitrygon heterura, the highest landing was 178 kg in February, followed by 130 kg in January and 66 kg in July. Weight of other ray species ranged between $0.2-114.2 \mathrm{~kg}$. The highest landing of sharks was $3,620 \mathrm{~kg}$ for Chiloscyllium punctatum followed by 216 kg for Atelomycterus marmoratus. The highest landing by month for Chiloscyllium punctatum was 644 kg in July followed by 458 kg in April and 433 kg in January. For Atelomycterus marmoratus, the highest landing was 41 kg in January followed by 40 kg in April and 25 kg in July. Weight of other shark species ranged between $0.4-59.4 \mathrm{~kg}$. The details are shown in Table 6.

### 2.1.6 Size Range of Sharks and Rays

In general most samples of Telatrygon biasa, Brevitrygon heterura and Neotrygon orientalis were mature size, while most sample of Hemitrygon akajei and Rhynchobatus australiae were immature size. For Aetobatus ocellatus and Maculabatis gerrardi were found only one individual as immature size. Most of small shark species (Atelomycterus marmoratus, Chiloscyllium griseum, C. hasseltii and C. plagiosum) landed were mature except for Chiloscyllium punctatum, that average sizes were less than mature size. First maturing size for this species is 65 cm , but most sample were immure size. For three (3) species of genus Carcharhinus and Hemigaleus microstoma were immature size. Size range of all sharks and rays species from are shown in Table 7.
Table 6: Weight of Sharks and Rays (in Kg) by Species from 115 Trawler Landings at Songkhla Fishing Port

| Species | 2015 |  |  |  |  | 2016 |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 2.1.7 Catch Per Unit Effort

Most of sharks and rays were caught by otter-board trawl and paired trawl. For trawls sampled during August 2015 to July 2016, all data were used to calculated catch per unit effort (CPUE) as follows: The days at operation by otter-board trawl and paired trawl were 1,432 days ( 4,697 hauls) and 8 days ( 32 hauls), respectively. The details are shown in Table 8A-8B. The CPUE of rays by otter-board trawl ranged between $0.03-2.20 \mathrm{~kg} / \mathrm{day}$ at operation and $0.01-0.67 \mathrm{~kg} / \mathrm{haul}$. The highest CPUE of rays from otter-board and paired trawl were Telatrygon biasa with $2.20 \mathrm{~kg} / \mathrm{day}$ at operation ( $0.67 \mathrm{~kg} / \mathrm{haul}$ ) and $0.74 \mathrm{~kg} / \mathrm{day}$ at operation ( $0.18 \mathrm{~kg} / \mathrm{haul}$ ). The details are shown in Table 9A-9B. The highest CPUE of sharks from otter-board and paired trawl were Chiloscyllium punctatum with $2.44 \mathrm{~kg} /$ day at operation ( $0.74 \mathrm{~kg} / \mathrm{haul}$ ) and $16.33 \mathrm{~kg} / \mathrm{day}$ at operation ( $4.08 \mathrm{~kg} / \mathrm{haul}$ ). The details are shown in Table 9C-9D. The number of ray individual calculated by using CPUE of ray was caught by otter-board trawl and paired trawl ranged between 0.04-8.12 ind/day and 1.88-2.50 ind/ day, respectively. The details are shown in Table 10A-10B. While the number of shark individual calculated by using CPUE of shark was caught by otter-board trawl and paired trawl ranged between 0.03-2.84 ind/day and 0.13-18.88 ind/day, respectively. The highest shark species of both gears were Chiloscyllium punctatum. The details are shown in Table 10C-10D.

### 2.1.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally. The major markets were wholesale market in Songkhla Province. The price varied according to species. The most expensive ray, Aetobatus ocellatus was sold at 50-120 Baht/kg followed by Rhynchobatus australiae at 60-80 Baht/kg. The price of Hemitrygon akajei, Telatrygon biasa, Neotrygon orientalis, Maculabatis gerrardi and Brevitrygon heterura were varied by size and sold at 20-60 Baht/kg. In general, bigger sized rays were more expensive than smaller ones. For sharks, the local price ranged between 20-125 Baht/kg. The most expensive sharks, Carcharhinus amblyrhynchos and C. sorrah were sold at 80-120 Baht/kg. While small sharks, Chiloscyllium spp. and Atelomycterus marmoratus were sold at 20-65 Baht/kg.

Normally the price at wet markets was about 20-50\% higher than at landing site. All sharks and rays were landed whole with fins. The details are shown in Table 11. Small, medium and big size category for each species is as shown in Appendix III.

Table 11: Price of Sharks and Rays by Species at Songkhla Landing Site during 2015-2016. All Prices in Baht per Kilogram. (Exchange rate: Baht 35= US\$ 1.00)

| Species | Range Price <br> (Baht/kg) | Part | Market Destination |
| :--- | :---: | :---: | :--- |
| Rays |  |  |  |
| Aetobatus ocellatus | $50-120$ | Whole body | Local market in Songkhla Province |
| Hemitrygon akajei | $20-60$ | Whole body | Local market in Songkhla Province |
| Telatrygon biasa | $20-60$ | Whole body | Local market in Songkhla Province |
| Maculabatis gerrardi | $20-60$ | Whole body | Local market in Songkhla Province |
| Brevitrygon heterura | $20-60$ | Whole body | Local market in Songkhla Province |

| Chiloscyllium plagiosum | $20-65$ | Whole body | Local market in Songkhla Province |
| Chiloscyllium punctatum | $20-65$ | Whole body | Local market in Songkhla Province |

### 2.2 Ranong

### 2.2.1 Landing Samples

A total of 70 trawlers were sampled during the study period. The highest by month was 11 in December, followed by 10 in January. The highest by gear type was 55 of otter-board trawls. The details are shown in Table 12.

Table 12: Number of Landings Sampled during the Study at Ranong Fishing Port

### 2.2.2 Fishing Ground and Catch Composition by Gear Type

The main gear landing sharks and rays was the trawl nets at $3,330 \mathrm{~kg}$ comprising from otter-board trawl $2,538 \mathrm{~kg}(76.2 \%)$ and paired trawl $792 \mathrm{~kg}(23.8 \%)$. The trawlers operated more than 3 nautical miles from the coastline. The highest landing of rays by month was from otter-board trawl at 651 kg in January and from paired trawl in February at 191 kg . While the highest landing of sharks by month from paired trawl in September at 91 kg and from otter-board trawl in October at 73 kg . The details are shown in Table 13.

### 2.2.3 Sharks and Rays Composition

A total of $1,155,913 \mathrm{~kg}$ of fish was landed from 70 landings during the study period. Rays and sharks made up $2,981 \mathrm{~kg}$ and $349 \mathrm{~kg}(0.26 \%$ and $0.03 \%)$ from the total landing, respectively. Total landings of bony fish was $1,152,529 \mathrm{~kg}$ or $99.71 \%$. Average landings per month for sharks and rays were 29 kg and 248 kg , respectively. The highest landing by month for rays was 651 kg in January, followed by 459 kg in November, and 370 kg in December. However, the highest landing for sharks was 95 kg in September, followed by 84 kg in October and 60 kg in November. In general, the landing of sharks and rays ranged between less than $0.01-0.20 \%$ and $0.08-0.75 \%$, respectively from total landing. The details are shown in Table 14.

### 2.2.4 Number of Sample

A total of 1,818 individuals belonging to 1,657 rays and 161 sharks were sampled comprising 14 species of rays and 9 species of sharks. The most abundant ray species was Rhinobatos formosensis followed by Brevitrygon heterura and Neotrygon orientalis. The highest number of rays sampled by month was 289 in January, followed by 245 in February and 230 in July. The most abundant shark species was Chiloscyllium hasseltii followed by C. punctatum and C. griseum. However, the highest number of sharks sampled by month was 74 in October, followed by 20 in January and 19 in February. The most common ray species were Neotrygon orientalis followed by Rhinobatos formosensis, Brevitrygon heterura and Maculabatis gerrardi. All these species were landed throughout the year. The most common shark species were Chiloscyllium punctatum and C. hasseltii. Both species were landed at least half of the year. Other species such as Aetobatus narinari, Hemitrygon akajei, D. thetidis, Gymnura japonica, Brevitrygon imbricata, Pateobatis jenkinsii, Pateobatis uanacoides, Plesiobatis daviesi, Rhynchobatus australiae, Taeniurops meyeni, Chiloscyllium griseum, Carcharhinus leucas, C. melanopterus, C. sorrah, Galeocerdo cuvier, Heptranchias perlo and Sphyrna lewini, were rarely landed and only landed between 1-4 months during the study period. The details are as shown in Table 15.
Table 15: Number of Sample of Sharks and Rays by Species at Ranong Fishing Port

### 2.2.5 Weight of Sharks and Rays by Species

A total of $3,330 \mathrm{~kg}$ was landed from 70 trawler landings comprising $2,981 \mathrm{~kg}$ rays and 349 kg sharks. For rays, the highest landing by weight was Rhinobatos formosensis amounting to 1,366 kg , followed by 636 kg Neotrygon orientalis and 408 kg Brevitrygon heterura. The highest landing by month was 432 kg for $R$. formosensis in January, followed by 287 kg in December and 155 kg in November. For Neotrygon orientalis, the highest landing was 210 kg in October, followed by 150 kg in September. For Brevitrygon heterura, the highest landing was 123 kg in January followed by 66 kg in October. Weight of other ray species ranged between $0.2-150.0 \mathrm{~kg}$. The highest landing of shark species was 91 kg for Galeocerdo cuvier followed by 66 kg for Chiloscyllium hasseltii and 63 kg for C. punctatum. The highest landing by month for G. cuvier was 77 kg in September. For Chiloscyllium hasseltii and C. punctatum, the highest landing in October were 47 kg and 32 kg , respectively. Weight of other shark species ranged between $0.5-50.0 \mathrm{~kg}$. The details are shown in Table 16.

### 2.2.6 Size Range of Sharks and Rays

About half of rays species sampled in 2015 were mature, namely Dasyatis thetidis, Brevitrygon heterura, Neotrygon orientalis, Rhinobatos formosensis and Taeniurops meyeni. The other species such as Aetobatus narinari, Hemitrygon akajei, Pateobatis jenkinsii, Maculabatis gerrardi and Rhynchobatus australiae were immature. The average size of Maculabatis gerrardi, which common species ranged between $21.0-46.5 \mathrm{~cm}$ disc length but no adult sized specimens were available (immediately removed by middlemen upon being landed). First maturing size for Maculabatis gerrardi is about 59.0 cm . It could be inferred that most of these species were exploited at the juvenile stage. Most shark species landed were mature except for Carcharhinus sorrah and Galeocerdo cuvier. First maturing size for these species are 105 cm and 230 cm total length, respectively. However, It could not be inferred the both sharks were exploited at the juvenile stage, because they were collected only one month for each species. While in 2016, half of ray species sample were mature except for Gymnura japonica, Maculabatis gerrardi, Plesiobatis daviesi and Rhynchobatus australiae. All of these species were juvenile. Almost of common rays, Neotrygon orientalis, Brevitrygon heterura and Rhinobatus formosensis were mature during this period. Most common shark species, Chiloscyllium griseum, C. hasseltii and C. punctatum were mature, but other sharks, Carcharhinus sorrah, Heptranchias perlo and Sphyrna lewini were immature. First maturing size for these species are $105 \mathrm{~cm}, 85 \mathrm{~cm}$ and 140 cm total length, respectively. Size range of all sharks and rays species are shown in Table 17.

### 2.2.7 Catch Per Unit Effort

Sharks and Rays were catch by otter-board trawl and paired trawl. For trawls sampled during September, 2015-August, 2016, all data were used to calculated catch per unit effort (CPUE) as follows: The total number of days at operation by otter-board trawl and paired trawl were 541 days ( 2,164 hauls) and 123 days ( 369 hauls), respectively. The details are shown in Table 18A-18B. The CPUE rays by otter-board trawl ranged between $0.04-2.17 \mathrm{~kg} /$ day at operation and 0.01-0.54 $\mathrm{kg} / \mathrm{haul}$, and by paired trawl was $0.02-1.88 \mathrm{~kg} / \mathrm{day}$ at operation and $0.01-0.63 \mathrm{~kg} / \mathrm{haul}$. The highest CPUE rays from otter-board and paired trawl were Rhinobatos formosensis with $2.17 \mathrm{~kg} / \mathrm{day}$ at operation ( $0.54 \mathrm{~kg} / \mathrm{haul}$ ) and $1.88 \mathrm{~kg} /$ day at operation ( $0.63 \mathrm{~kg} / \mathrm{haul}$ ), respectively. The details are shown in Table 19A-19B. The highest CPUE sharks from otter-board was Chiloscyllium hasseltii with $0.11 \mathrm{~kg} /$ day at operation ( $0.03 \mathrm{~kg} / \mathrm{haul}$ ) and paired trawl was Galeocerdo cuvier with 0.67 $\mathrm{kg} / \mathrm{day}$ at operation ( $0.22 \mathrm{~kg} / \mathrm{haul}$ ). The details are shown in Table 19C-19D. The number of ray individual calculated by using CPUE of ray was caught by otter-board trawl and paired trawl ranged between 0.03-3.19 and 0.02-1.89, respectively. The details are shown in Table 20A-20B. While the number of shark individual calculated by using CPUE of shark was caught by otter-board trawl and paired trawl ranged between 0.02-0.15 and 0.02-0.24, respectively. The highest shark species of both gears were Chiloscyllium hasseltii and C. griseum. The details are shown in Table 20C-20D.

### 2.2.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally similar to Songkhla. The major markets were wholesale market in Ranong Province. The price varied according to species. The most expensive ray, Aetobatus narinari was sold at 50-120 Baht/kg followed by Maculabatis gerrardi at 12-100 Baht/kg. The price of Hemitrygon akajei, Telatrygon biasa, Neotrygon orientalis, Brevitrygon heterura and Rhynchobatus australiae were varied by size and sold at 20-60 Baht/kg. In general, bigger sized rays were more expensive than smaller ones. Utilization of Aetobatus narinari is used only for consumption and Maculabatis gerrardi is the major species using for leather industries and consumption. The normal price of sharks ranged between 20-125 Baht/kg. The most expensive sharks, Carcharhinus leucas, C. melanopterus and C. sorrah were sold at 80-110 Baht/kg,

Normally the price at wet markets was about 20-50\% higher than at landing site. All sharks and rays were landed whole with fins. The details are shown in Table 21. Small, medium and big size category for each species is as shown in Appendix III.

Table 21: Price of Sharks and Rays by Species at Ranong Landing Site during 2015-2016. All Prices in Baht per Kilogram. (Exchange rate: Baht 35= US\$ 1.00)

| Species | Range Price <br> (Baht/kg) | Part | Market Destination |
| :--- | :---: | :--- | :--- |
| Rays |  |  |  |
| Aetobatus narinari | $50-120$ | Whole body | Local market in Ranong Province |
| Hemitrygon akajei | $15-50$ | Whole body | Local market in Ranong Province |
| Dasyatis thetidis | 20 | Whole body | Local market in Ranong Province |
| Gymnura japonica | $15-45$ | Whole body | Local market in Ranong Province |
| Maculabatis gerrardi | $12-100$ | Whole body | Local market in Ranong Province |
| Brevitrygon imbricata | $15-52$ | Whole body | Local market in Ranong Province |
| Pateobatis jenkinsii | $20-60$ | Whole body | Local market in Ranong Province |
| Pateobatis uanacoides | $15-65$ | Whole body | Local market in Ranong Province |
| Brevitrygon heterura | $15-52$ | Whole body | Local market in Ranong Province |
| Neotrygon orientalis | $11-57$ | Whole body | Local market in Ranong Province |
| Plesiobatis deviesi | 20 | Whole body | Local market in Ranong Province |
| Rhinobatos formosensis | $8-40$ | Whole body | Local market in Ranong Province |
| Rhynchobatus australiae | $15-60$ | Whole body | Local market in Ranong Province |
| Taeniurops meyeni | 12 | Whole body | Local market in Ranong Province |
| Sharks |  |  |  |
| Carcharhinus leucas | $80-110$ | Whole body | Local market in Ranong Province |
| Carcharhinus melanopterus | $80-110$ | Whole body | Local market in Ranong Province |
| Carcharhinus sorrah | $80-110$ | Whole body | Local market in Ranong Province |
| Chiloscyllium griseum | $33-63$ | Whole body | Local market in Ranong Province |
| Chiloscyllium hasseltii | $24-70$ | Whole body | Local market in Ranong Province |
| Chiloscyllium punctatum | $24-70$ | Whole body | Local market in Ranong Province |
| Galeocerdo cuvier | $30-50$ | Whole body | Local market in Ranong Province |
| Heptranchias perlo | $39-64$ | Whole body | Local market in Ranong Province |
| Sphyrna lewini | $35-50$ | Whole body | Local market in Ranong Province |

### 3.0 CONCLUSION

A pilot project on recording landing data of sharks and rays up to species level was conducted in the Southern Thailand. During this project 20 officers of Department of Fisheries were trained in taxonomy and in data collection using the new harmonized format. Two provinces of Southern Thailand, namely Songkhla and Ranong were selected as the study sites as they were the main landing sites of sharks and rays in the Southern Thailand. The landing data were collected at 2 fishing ports under Fish Marketing Organization of each province.

A total of 13 species of sharks from 3 Orders and 6 Families, and 16 spesies of rays from 2 Orders and 6 Families were recorded. Ranong recorded the highest with 9 species of sharks and 14 rays and Songkhla with 9 species of sharks and 7 rays. Details are shown in Appendix I. In term of percentage of total marin landings, sharks and rays only contributed $0.37 \%$ and $0.39 \%$ at Songkhla, and $0.03 \%$ and $0.26 \%$ at Ranong respectivley. These figures confirmed earlier data as published in Fisheries Statistics of Thailand that both of sharks and rays were only by-catch and not targeted and contributed less than $0.5 \%$ of the total marine landing.

The most abundant shark species at Songkhla were Chiloscyllium punctatum and Atelomycterus marmoratus and for rays were Telatrygon biasa and Brevitrygon heterura. The most common shark species were Chiloscyllium. punctatum, and Atelomycterus marmoratus while for rays were Telatrygon biasa, Brevitrygon heterura, Hemitrygon akajei and Neotrygon orientalis.

The most abundant sharks species at Ranong were Chiloscyllium hasseltii, C. punctatum and C. griseum while for rays were Rhinobatos formosensis, Brevitrygon heterura and Neotrygon orientalis. The most common shark species were Chiloscyllium punctatum and C. hasseltii while for rays were Neotrygon orientalis, Rhinobatos formosensis, Brevitrygon heterura, and Maculabatis gerrardi.

All big sized sharks of more than 2 meters in total length such as Carcharhinus leucas and Galeocerdo cuvier, medium sized sharks such as C. melanopterus, C. amblyrhynchos and C. sorrah were rarely caught due to nature of fishing area and gear used. Usage and marketing information from this study also confirmed earlier report in the draft NPOA-Shark that all sharks and rays were landed whole, fully utilised with no finning activities on board of vessels.

### 4.0 OUTPUT AND OUTCOME

The project outputs and outcomes are summarised in Table 22 as shown below.
Table 22: Output and Outcome

| No | Output | Outcome |
| :---: | :--- | :--- |
| 1. | Twenty trained personnel in sharks and rays <br> taxonomy from the Department of Fisheries, <br> Thailand. | Trained staffs are now able to make the right <br> and valid identification of species. Training <br> materials stored electronically and easy to <br> excess. |
| 2. | A standardised format for data collection for <br> national activity produced. | Improved technique of data collection for im- <br> plementation at national level |
| 3. | Detailed information on the percentages of <br> sharks and rays from the total landing at <br> pilot project sites. | Confirmed earlier data published in Fisher- <br> ies Statistics of Thailand. Both of sharks and <br> rays were not targeted and contributed less <br> than 0.5\% of total marine landing. |

| 4. | Information on relative dominance of the <br> different species of sharks and rays obtained. | Increased awareness of needs and measures <br> for shark conservation and management on <br> specific species. |
| :---: | :--- | :--- |
| 5. | Information on the monthly fluctuation of the <br> different species of sharks and rays obtained. | Trends of landings by species analysed for <br> national level management. |
| 6. | Stage of maturity for the different species of <br> sharks and rays determined. | Increased awareness of needs and measures <br> for shark conservation and management <br> among stakeholders |
| 7. | Information on usage and marketing of the <br> landed sharks and rays were obtained from <br> the pilot project. | Confirmed earlier report in the draft NPOA- <br> Sharks that all sharks and rays are landed <br> whole, fully utilised with no finning activities <br> onboard vessels. |
| 8. | A report on landing of sharks and rays up <br> to species level from 2 sites in Southern <br> Thailand. | Data recording on sharks and rays will be <br> improved from generic terms 'sharks' and <br> 'rays' to species level. |
| 9. | Issues and problems arising from this activity <br> identified and improvements made especially <br> with the data collection format | Development of a comprehensive national <br> data collection system for sharks and rays <br> as part of the National Plan of Action Sharks |
| 10. | Specimens collected during sampling <br> activities deposited for future reference. | Some specimens were collected at <br> Reference Collection of Phuket Marine <br> Biological Center (PMBC) |

### 5.0 FUTURE ACTIVITIES

Thailand recorded landing data up to species level at landing sites along the coastal province of Thailand since 2011. Data collection at the current 2 landing sites is to be continued. The draft NPOA-Sharks is completing, that Department of Fisheries has a plan for organizing stakeholder consultation in this year before the improvement of NPOA-Sharks and proclamation next year. All activities are shown in Appendix II

### 1.0 INTRODUCTION

Vietnam is a home to a rich diversity of sharks, rays, skates and chimaeras (Class Chondrichthyes). However, sharks, rays and skates landings contributed less than $1 \%$ of total marine landings. Research on sharks, rays and skates had not been fully conducted in freshwater, estuarine and the Economic Exclusive Zone of Vietnam. During 2000-2005, thirty-six independent research surveys using different fishing gears were conducted in Vietnamese waters. A total of 40 species belonging to 19 genera in 9 families of two Orders were recorded. Species richness was observed in the South-eastern and central waters. Family of Dasyatidae is the highest abundance with 14 species. Distribution of rays was showed seasonal differences (Tran Van Cuong and Vu Viet Ha, 2005).

### 1.1. Objective

The objectives of this project were:

- to enhance human resource development in elasmobranch taxonomy, and
- to improve landing data recording from generic 'sharks' and 'rays' to species level.

### 1.2. Data Collection at Landing Sites

### 1.2.1. Selection of Study Sites

Ba Ria - Vung Tau and Binh Thuan are two provinces in the Southeast regional with the main regionals of fishing landing in Vietnam. Vung Tau and Lagi towns were selected as study sites. Both sites are major landing sites of shark and ray. The landing data were collected at seven jetties, such as Ben Da, Incomat, Cat Lo, Phuoc Tinh and Ward 5 jetties in Ba Ria Vung Tau province and Lagi, Phan Thiet jetties in Binh Thuan province. All jetties are government enterprises with the most of sharks, rays and skates landing were from trawlers, gillnets and longlines fisheries. Locations of all landing sites are shown in Figure 1.

Figure 1: Location of Study Sites in Ba Ria-Vung Tau and Binh Thuan Provinces

### 1.2.2. Fishery Structure and Background of Study Sites

### 1.2.2.1. Vung Tau

Vung Tau is one of the major landing sites for sharks and rays in Ba Ria Vung Tau. The major gears were trawl nets (520), followed by gillnets (200) and purse seine (50). All trawlers are normally operated by $2-10$ crew members. Almost all of the sharks and rays were landed by trawlers and gillnets operating beyond 24 nautical miles ( nm ) from the coastline. Fishing operation normally between 10-30 day per trip. The details of fishing vessels registered in this district are shown in Table 1.

Table 1. Number of Licensed Fishing Vessels by Gears and Number of Fishers Site Vung Tau

| No | Type of Gear | Fishing Operation (from coastline) | No. of Vessel | No. of fishers |

|  | Total |  | 2,200 | 10,333 |

### 1.2.2.2. Binh Thuan

La Gi and Phan Thiet are two of the major landing sites for sharks and rays in Binh Thuan. The major gears were gillnets (463), followed by longlines (412) and trawl nets (411) and Other gears (572). The details of the fishing vessels registered in this district are shown in Table 2. The major gears landing sharks and rays were trawl nets, gillnets and longlines. All trawlers are normally operated by 2 - 10 crew members. The fishing operation for trawlers and longlines was normally between 10-20 days per trip.

Table 2. Number of Licensed Fishing Vessels by Gears and Number of Fishers Site Binh Thuan

|  | Total |  | 2,047 | 7,869 |

### 1.3. APPOINTMENT OF ENUMERATORS

Five Assistant Fisheries Officers from South Research Sub-Institute for Marine Fisheries, Vung Tau city, Viet Nam were appointed as enumerators. Their names are as follows:

1) Bui Quang Manh, marine biodiversity researcher.
2) Cao Van Hung, taxonomist as researcher.
3) Nguyen Xuan Toan, marine aquaculture researcher.
4) Dinh Xuan Hung, fishing oceanography technologist.
5) Nguyen Phuoc Trieu, taxonomist as researcher.

### 1.4. Materials and Methods

### 1.4.1. Sampling Methods

The sampling activity was started in September 2015 until 31 August 2016. All enumerators were requested to record landing data and other related information in a standard form at least 5 days/month. A standard SOP entitled 'Standard Operating Procedures Sharks, Rays and Skates Data Collection in the Southeast Asian Waters' was used as a guide. The content included Standard Operation Procedure and instructions to enumerators on how to measure, weigh, record sharks and rays species at sampling sites, name of enumerator, name of landing site, date of sampling, vessel registration number, vessel GRT, fishing area, price at landing sites, name of species (common name and scientific name), total catch of sharks, rays, commercial and low-value species from each sampling vessel. The completed data in excel were then submitted to the respective National Coordinator before submitted to SEAFDEC/MFRDMD before second week of the following month for verification. The data were analysed at the end of each quarter.

### 1.4.2. Selection of Fishing Vessels and Sampling Activities

Between 1-4 fishing vessels were selected for sampling each day for five days per month at each landing site. Measurement of Total length (TL) were taken for all skates, sharks species and rays from the Families Rhynchobatidae, Rhinobatidae and Narcinidae. While Disc Length (DL) were taken for all ray species where the tail is frequently absent or damaged (mainly from the Families Dasyatidae, Gymnuridae and Mobulidae). All sharks and ray specimens were measured and weighed individually if the total number was less than 50 individuals per vessel. If the total number was more than 50 individuals, only $10-50 \%$ were measured. The maturity stage for each individual was estimated according to Yano et al. (2005) and Ahmad and Annie Lim (2012). The total catch of all sharks and rays by species as well as the total catch of commercial and lowvalue species were also recorded for each sampling vessel. Some samples were brought back to the South Research sub Institute for marine fisheries and preserved for future reference. Larger specimens were photographed, and their basic taxonomic and biological characteristics noted.

### 1.4.3. Classification

The classification (scientific names) used in this report follows that of Compagno (1999), Yano et al. (2005), Ahmad and Annie Lim (2012), Ahmad et al. (2013) and Ahmad et al. (2014), Ebert et al. (2013) and Last et al. (2016).

### 2.0 RESULTS

### 2.1 Binh Thuan province

### 2.1.1 Landing sample

In total 123 fishing vessels were sampled during the study period, 103 trawlers were sampled and only nine vessels of gillnet and 11 vessels of longlines fisheries. The highest landing sample by month was 14 vessels in December, followed by 13 in November. In August, the only seven vessels were surveyed because the storm touched Vietnam land so many vessels in Binh Thuan province could not fishing at all.

### 2.1.2 Fishing Ground and Catch Composition by Gear Type

In the study, rays and skates mainly were sampled from Trawl net fishery. The highest catch of rays was $1,046.9 \mathrm{~kg}$ in September and and skates was $1,798.0 \mathrm{~kg}$ in April. Sharks mainly were sampled from longline fishery reached $80 \%$ in only May and June 2016, but sharks were sampled every month in gillnets and trawl nets in light weight. Catch of skates and rays reached over 90\% from Trawl net. The details are shown on Table 6.
Table 4. Weight of Sharks, Rays and Skates (Kg) Caught by Difference Type of Gear

| Species | Jan | Feb | March | April | May | June | July | Aug | Sept | Oct | Nov | Dec | Grand Total |

### 2.1.3 Sharks and Rays Composition

A total of 2,096,590.5 kg of fish was landed from 133 landings during the study period, catch of sharks, rays and skates made up $0.4 \%$ and $0.3 \%$ and $0.5 \%$ from the total landing respectively. While landings of bony fish species was 98.81 \%. The average landings per month for sharks, rays and skates were $659.9 \mathrm{~kg}, 491.3$ and 929.7 kg respectively. The highest landing by month for sharks was $3,894.9 \mathrm{~kg}$ in June, followed by $2,550.0 \mathrm{~kg}$ in May. From February to April of 2016, sharks were not sampled. The highest landing of rays was $1,421.7 \mathrm{~kg}$ in October, followed by $1,046.9 \mathrm{~kg}$ in September, for skates was $1,798.0 \mathrm{~kg}$ in April, followed by $1,414.0 \mathrm{~kg}$ in January. The catch of sharks, rays and skates was under $1 \%$ in total catch of all Pfisheries in Binh Thuan province. The details are shown on Table 5.

Table 5. Catch Composition of Sharks, Rays, Skates, Commercial and Low-value Species by Month from 133 Landings at Binh Thuan Province. All Weight in Kilogram.

### 2.1.4 Sample Size

A total of 1,589 individuals belong to 409 rays, 199 sharks and 981 skates were sampled consisting of 28 species of rays, three species of skates and 12 species of sharks. The most abundant ray species were Brevitrygon heterura, followed by Brevitrygon imbricata. The highest number of rays were sampled by month was 74 individuals in June and October, followed by 73 individuals in December. Rays were sampled mainly in from June to December of the year. While the highest number of sharks were sampled by month was 94 individuals in June, followed by 41 individuals in May, the highest number of sharks was Carcharhinus sorrah species with 129 individuals in the study. The highest number of skate were sampled by month was 138 individuals in January, followed by 117 in December. Only Three species of skates were recorded namely Okamejei cairae, O. hollandi and O. cf. boesemani. Okamejei cairae species was sampled in all months with rate of over $90 \%$ in total skate. The details are shown on Table 6.

### 2.1.5 Weight of Sharks and Rays by Species

A total shark and ray species of $24,355.5 \mathrm{~kg}$ was landed from 133 landings comprising $4,980.4 \mathrm{~kg}$ rays, $11,456.4 \mathrm{~kg}$ skates and $7,918.8 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was Brevitrygon heterura amounted $1,586.5 \mathrm{~kg}$, followed by $1,053.6 \mathrm{~kg}$ for Brevitrygon imbricata. For sharks, the highest landing was $6,995.3 \mathrm{~kg}$ for species of Carcharhinus sorrah, followed by 329.5 kg and 300.0 kg for C. limbatus and Galeus sp., respectively. For skates, Okamejei cairae reached highest weight of $9,904.8 \mathrm{~kg}$ from January to May and in December landings was more than $1,000 \mathrm{~kg}$.

### 2.1.6 Size Range of Sharks and Rays

In general, all ray species sampled from January to May were mature. Size range of all rays from January to May was shown in Table 6.

The most ray species landed from September to December were mature except for Aetobatus ocellatus (mature at $100-110 \mathrm{~cm}$ ), Gymnura poecilura (mature at 45 cm ). Size range of all rays from September to December were shown in Table 7.

The most shark species landed from January, May and September to December were mature except for Carcharhinus limbatus (mature at $120-190 \mathrm{~cm}$ ), C. sorrah (mature at 103 cm ), Chiloscyllium plagiosum (mature at 50 cm ) and C. punctatum (mature at 68 cm ). Size range of sharks in January, May and from September to December was shown in Table 8.

### 2.1.7 Fishing Effort and CPUE (Catch per Unit Effort)

Monthly fishing efforts (days at operation, total number of operation during the cruise) of the sampled vessels are summarized in Table 10 and Table 11.

Table 10. Days at Operation by Gear Sampled During the Study Period at Landing Site in 2015-2016 in Binh Thuan.

### 2.1.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally and some were exported to China. The major markets were whole sale market in Lagi, Phan Thiet towns and other major towns in Ho Chi Minh city. The price varied according to species. The most expensive rays were families of Myliobatidae and Mobulidae. All rays and sharks were sold in price of whole body, but some species were cut in parts. The details was shown in Table 18.

Table 18. Price of Sharks, Rays and Skates by Species at Binh Thuan Landing Sites 2015. All prices in USD per Kilogram (1USD=22,260VND)

| Species name | Range price USD/kg | Part | Marketing destination |
| :--- | :---: | :---: | :--- |
| Brevitrygon cf. javaensis | $1.0-1.2$ | Whole body | Local market |
| Platyrhina sinensis | $0.4-1.0$ | Whole body | Local market |

| Okamejei hollandi | $0.1-1$ | Whole body | Local market |

### 2.2 Ba Ria-Vung Tau Province

### 2.2.1 Landing sample

In total 112 fishing vessels were sampled during the study period, 50 trawler were sampled and only 62 vessels of gillnet fisheries. The highest landing sample by month was 12 vessels in May, August and September.

Table 19. Number of Landing Sampled During the Study at Ba Ria-Vung Tau Province

| Type of Gear | Months |  |  |  |  |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 2.2.2 Fishing Ground and Catch Composition by Gear Type

In Ba Ria-Vung Tau, rays and skates were sampled from trawl net and gillnet fisheries. The highest catch of rays and skates were $4,534.6 \mathrm{~kg}$ and $2,235.4 \mathrm{~kg}$ in October respectively. Sharks were sampled from both gillnet and trawl net in Baria-Vung Tau in whole of months with $73 \%$ from gillnet and $27 \%$ from trawl net. Skates were collected only from trawl net fishery and reached $37 \%$ in total elasmobranch catch. Catch of skates and rays are higher than of sharks in the study. The details are shown in Table 18.
Table 20. Weight of Sharks, Rays and Skates (Kg) Caught by Different Type of Gear at Vung Tau

| Species | 2015 |  |  |  | 2016 |  |  |  |  |  |  |  | Grand Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Grand Total | 1,738.8 | 8,167.9 | 2,328.6 | 458.4 | 2,214.1 | 219.6 | 929.6 | 265.9 | 2,600.4 | 1,591.2 | 1,250.0 | 1,835.1 | 23,599.5 |

### 2.2.3 Sharks and Rays Composition

A total of $3,602,563.6 \mathrm{~kg}$ of fish was landed from 112 landings during the study period. Sharks, rays and skates made up $0.2 \%, 0.3 \%$ and $0.2 \%$ in total catch landing respectively, while landings of bony fish species were $99.34 \%$. The elasmobranch catches gained small rate under $0.5 \%$ in total catch. The average landings per month for sharks, rays and skates were 504.8 kg , 754.2 and 721.3 kg respectively. The highest landing by month for sharks was $1,397.9 \mathrm{~kg}$ in October, followed by $1,222.1 \mathrm{~kg}$ in January. The highest landing of rays was $4,497.7 \mathrm{~kg}$ in October, followed by $1,046.9 \mathrm{~kg}$ in September. The highest landing of skates was $2,235.4 \mathrm{~kg}$ in October, followed by $1,793.0 \mathrm{~kg}$ in May. The details are shown in Table 19.

### 2.2.4 Sample Size

A total of 1,037 individuals belong to 239 rays, 398 sharks and 400 skates were sampled consisting 22 species of rays, two species of skates and 22 species of sharks. The most ray species were Narcine indica, Brevitrgon heterura and Brevitrygon imbricata. The most shark species were Carcharhinus sorrah and Chiloscyllium punctatum. The highest number of rays were sampled by month was 74 individuals in June and October, followed by 73 individuals in December. Rays were sampled mainly from June to December of the year. While the highest number of sharks were sampled by month was 94 individuals in June, followed by 41 individuals in May, the highest number of sharks was Carcharhinus sorrah species with 129 individuals in the study. Skates were sampled only two species of Okamejei cairae and Okamejei hollandi with the mostly Okamejei cairae reached over 90\%. The details are shown in Table 20.

Table 22. Sampled Size of Sharks, Rays and Skates by species

| Species | J | F | M | A | M | J | J | A | S | 0 | N | D | Total |

### 2.2.5 Weight of Sharks and Rays by Species

A total of $23,599.5 \mathrm{~kg}$ was landed from 112 landings comprising $8,886.6 \mathrm{~kg}$ rays, $8,655.1$ kg skates and $6,057.8 \mathrm{~kg}$ sharks. For rays, the highest landing by weight was Mobula thurstoni, followed by Pateobatis jenkinsii. For sharks, the highest landing was $10,810.73 \mathrm{~kg}$ for species of Carcharhinus sorrah, followed by 359.0 kg and 300 kg for Carcharhinus limbatus and Galeus sp . respectively. The highest landing of sharks by month was $3,871.2 \mathrm{~kg}$ of Carcharhinus sorrah, followed by Chiloscyllium punctatum was 779.2 kg . For skates, Okamejei cairae reached highest weight of $7,596.1 \mathrm{~kg}$, the months of May, August, October and November was over $1,000 \mathrm{~kg}$ for the species.
Table 23.Weight of Sharks, Rays and Skates (in kg) by Species from Six Landings at Ba Ria-Vung Tau

### 2.2.6 Size Range of Sharks and Rays

In general, most rays and shark species landed from January to May and from September to December were mature except to Mobula thurstoni (mature 198cm). Plesiobatis daviesi (mature at 130 cm ), Atelomycterus marmoratus (mature at 45 cm ). Carcharhinus limbatus (mature at 120 cm ), Carcharhinus sorrah matures at 103-128 (male) 110-118cm (female). Chilocyllium puctatum matures at $68-76 \mathrm{~cm}$. Galeocerdo cuvier matures at $300-305 \mathrm{~cm}$ for males and $250-350 \mathrm{~cm}$ for females (TL). The details are shown in Table 22 and Table 23.
Table 24. Size Range of Sharks, Rays and Skates (Disc length) except for Narcine spp., Narke spp., Platyrhina sinensis, Rhinobatos formoensis, Rhynchobatus australiae and Okamejei spp. from September - December 2015. All Measurements in cm.

### 2.2.7 Fishing Effort and CPUE (Catch per Unit Effort)

Monthly fishing efforts (days at operation) total number of operation during the cruise) of the sampled vessels are summarized in Table 26 and Table 27.

Table 26. Total Days at Operation by Gears Sampled During the Study Period at Ba Ria-Vung Tau State in 2015-2016.

| Type of Gear | 2015 |  |  |  | 2016 |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | S | 0 | N | D | J | F | M | A | M | J | J | A |  |
| Gillnet | 167 | 155 |  | 174 | 108 | 115 | 115 | 155 |  | 102 | 176 |  | 1,267 |
| Trawl net | 167 | 294 | 480 | 61 | 225 | 46 | 147 | 82 | 374 | 147 | 65 | 239 | 2,327 |
| Total | 334 | 449 | 480 | 235 | 333 | 161 | 262 | 237 | 374 | 249 | 241 | 239 | 3,594 |

Table 27. Total Numbers of Operation by Gears Sampled During the Study Period at Ba Ria-Vung Tau State in 2015-2016.

| Type of Gear | 2015 |  |  |  | 2016 |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | S | 0 | N | D | J | F | M | A | M | J | J | A |  |
| Gillnet | 167 | 155 |  | 174 | 108 | 115 | 115 | 155 |  | 102 | 236 |  | 1,327 |
| Trawl net | 501 | 756 | 1434 | 183 | 649 | 138 | 441 | 246 | 914 | 441 | 166 | 651 | 6,520 |
| Total | 668 | 911 | 1434 | 357 | 757 | 253 | 556 | 401 | 914 | 543 | 402 | 651 | 7,847 |

In case of the gear of which annual effort excess 1,000 days of operation or 1,000 number of operations. CPUE (total of 12 months) was estimated by weight and number of individuals by species. The top 10 species for sharks, rays and skates are summarized in Table 28 to Table 37.

### 2.2.8 Usage and Marketing

Information on marketing collected at this landing site indicated that most sharks and rays were consumed locally and some were exported to China. The major markets were wholesale market in Vung Tau city, Tan Thanh and in Ho Chi Minh city. The price varied according to species. The most expensive rays were families of Myliobatidae and Mobulidae. All rays and sharks were sold of whole body, but some species were cut in parts. The skates species is the cheapest. The details are shown in Table 38.

Table 38.Price of Sharks, Rays and Skates by species at Ba Ria-Vung Tau landing sites 2015. All price in USD/kg (apply for 01 USD=22260 VND)

| Group | Sc.name | Rang price (USD/kg) | Marketing |
| :---: | :---: | :---: | :---: |
| Rays | Hemitrygon sinensis | 1-2 | local market and Ho Chi Minh City |
|  | Telatrygon zugei | 1-2 | Ho Chi Minh City and local market |
|  | Brevitrygon imbricata | 1-2.2 | local market, Ho Chi Minh city and China |
|  | Pateobatis jenkinsii | 1-2 | local market and Ho Chi Minh City and China |
|  | Urogymnus granulatus | 2-5 | local market an Ho Chi Minh City |
|  | Brevitrygon heterura | 1-2 | local market and Ho Chi Minh City |
|  | Mobula thurstoni | 1-1.8 | Local market and Ho Chi Minh City and China |
|  | Nacine brevilabiata | 1-2 | China,Ho Chi Minh City and local market |
|  | Narcine indica | 0.2-1.7 | China, Ho Chi Minh City and Local market |
|  | Narke japonica | 0.2-2 | China, local market |
|  | Neotrygon orientalis |  | China, Ho Chi Minh city and local market |
|  | Platyrhina sinensis | 0.2-1.5 | China, local market and Ho Chi Minh City |
|  | Platyrhina tangi | 1,5-1,6 | Local market |
|  | Plesiobatis daviesi | 1-2 | Ho Chi Minh City, China and local market |
|  | Rhinobatos formosensis | 1-2 | China, Ho Chi Minh City and Local market |
|  | Rhynchobatus australiae | 1-2 | Local market and Ho Chi Minh City |
|  | Rhynchobatus palpebratus | 1.7-2 | Local market, China and Ho Chi Minh City |
| Sharks | Alopias pelagicus | 3-5 | China, Ho Chi Minh City local market |
|  | Atelomycterus marmoratus | 1-2 | Ho Chi Minh City and local market |
|  | Atelomycterus marmoratus | 1.5-5 | Local market and China |
|  | Carcharhinus amblyrhynchos | 1-2 | Local market and Ho Chi Minh City and China |
|  | Carcharhinus cf. falciformis | 1-2 | Local market and Ho Chi Minh City |
|  | Carcharhinus dussumieri | 1-2 | Local market and Ho Chi Minh City |
|  | Carcharhinus limbatus | 1-2.5 | China, Ho Chi Minh City and local market |
|  | Carcharhinus sorrah | 1-6 | China, Ho Chi Minh City, China and local market |
|  | Cephalocyllium circulopullum | 1-2 | China, local market and Ho Chi Minh City |
|  | Chiloscyllium plagiosum | 1-2 | China, local market and Ho Chi Minh City |
|  | Chiloscyllium punctatum | 1-2 | China, local market and Ho Chi Minh City |
|  | Galeocerdo cuvier | 1-2 | local market and Ho Chi Minh City and china |
|  | Halaelurus buergeri | 1-2 | China, local market |
|  | Hemigaleus microstoma | 1-6 | China, Ho Chi Minh City and local market |
|  | Mustelus manazo | 1-2 | Ho Chi Minh City and local market |
|  | Sphyrna mokarran | 1-3 | China, Ho Chi Minh City and local market |
|  | Squalus megalops | 1-2 | Ho Chi Minh City and local market |
|  | Squatina sp | 1-2 | Ho Chi Minh City and local market |
|  | Squatina tergocellatoides | 1-2 | Ho Chi Minh City and local market |
|  | Triaenodon obesus | 1-2 | China, Ho Chi Minh City and local market |
| Skates | Okamejei cairae | 0.2-2 | China, Ho Chi Minh City and local market |
|  | Okamejei hollandi | 0.2-2 | China, Ho Chi Minh City and local market |

### 3.0 CONCLUSION

A pilot project on recording landing data of sharks and rays up to species level was conducted in the State of Binh Thuan and Ba Ria-Vung Tau. During this project four researchers of RIMF and SORESIMF were trained in taxonomy and in data collection using the new harmonized format. Three districts (towns) facing the Vung Tau city, La Gi and Phan Thiet Towns were selected as the study sites as they were the main landing sites of sharks, rays and skates in the states. The landing data were collected at 7 jetties i.e five in Vung Tau city and two in Binh Thuan province.

A total of 29 species of sharks from seven (7) Orders and 12 Families, and 39 species of rays from five Orders and 14 Families, and four species of skate from one Order and one family were recorded. Ba Ria-Vung Tau recorded the highest with 24 species of sharks and 23 species of rays and three skates. Binh Thuan recorded with 12 species of sharks and 27 rays and three skates. Details are shown in Appendix I. In term of percentage of total marine landings, sharks, rays and skates only contributed $0.4 \%, 0.3 \%$ and $0.5 \%$ at Binh Thuan province and $0.2 \%, 0.3 \%$ and $0.2 \%$ at Baria-Vungtau province respectively.

The most abundant shark species at Binh Thuan were Chiloscyllium punctatum, Carcharhinus sorrah and for rays Brevitrygon imbricata, Telatrygon zugei and Brevitrygon heterura and for skates, Okamejei cairae, O. holandi. Species of O. cairae very common catch from trawl net in Binh Thuan (Lagi jetty).

The most abundant shark species at Ba Ria-Vung Tau were Chiloscyllium punctatum, Carchahinus sorrah and Atelomycterus marmoratus while for rays Brevitrygon heterura, Brevitrygon imbricata, Neotrygon orientalis, Pateobatis jenkinsii and Telatrtygon zugei. The most common shark species were C. sorrah while for rays Brevitrygon heterura, Telatrygon zugei and Gymnura japonica.

All big sized sharks of less than two meters (except to Alopias pelagicus) in total length. Usage and marketing information from this study also confirmed at jetties that all sharks and rays were sold to middlemen at local jetty. The price of whole catch was determined by buyers at fishing ports.

### 4.0 OUTPUT AND OUTCOME

The project outputs and outcomes are summarised in Table 37 as shown below.

## Table 39. Output and Outcome

| No | Output | Outcome |
| :--- | :--- | :--- |
| 1. | Six trained personnel in sharks and rays <br> taxonomy from the Research Institute <br> for Marine Fisheries (RIMF) and Southt <br> Research sub - Institute for Marine Fisheries <br> (SORESIMF). | Trained staffs are now able to make the <br> right and valid identification of species. <br> Training materials stored electronically <br> and easy to excess. |
| 2. | A standardised format for data collection for <br> national activity produced. | Improved technique of data collection for <br> implementation at national level |
| 3. | Detailed information on the percentages of <br> sharks and rays from the total landing at pilot <br> project sites. | Confirmed earlier data published in <br> Vietnam National Statistics. Sharks and <br> rays were not targeted and contributed <br> to only about 2\% of total marine landing. |

| 4. | Information on relative dominance of <br> the different species of sharks and rays <br> obtained. | Increased awareness of needs and <br> measures for shark conservation and <br> management on specific species. |
| :---: | :--- | :--- |
| 5. | Information on the monthly fluctuation of <br> the different species of sharks and rays <br> obtained. | Trends of landings by species analysed <br> for national level management. |
| 6. | Stage of maturity for the different species of <br> sharks and rays determined. | Increased awareness of needs and <br> measures for shark conservation and <br> management among stakeholders |
| 7. | Information on usage and marketing of the <br> landed sharks and rays were obtained from <br> the pilot project. | Confirmed earlier report in current NPOA- <br> Sharks that all sharks and rays are <br> landed whole, fully utilised with no finning <br> activities onboard vessels. |
| 8. | A report on landing of sharks and rays up to <br> species level from three sites in Binh Thuan <br> and Vung Tau. | Data recording on sharks and rays will be <br> improved from generic terms 'sharks' and <br> 'rays' to species level. |
|  | Issues and problems arising from this activity <br> identified and improvements made especially <br> with the data collection format | Development of a comprehensive national <br> data collection system for sharks and <br> rays as part of the National Plan of Action <br> Sharks |
| 10. | Specimens collected during sampling <br> activities deposited for future reference. | A national repository for elasmobranchs <br> has been established at the Research <br> Institute Marine Fisheries |

### 5.0 FUTURE ACTIVITIES

In Vietnam should be collected more elasmobranchs data not only in the south of Nation but include from North and Centre of the country to get more information. All information will be useful to develop National Plan of Action for Conservation and Management of Sharks in Vietnam

## Southeast Asian Fisheries Development Center (SEAFDEC)

## What is SEAFDEC?

SEAFDEC is an autonomous intergovernmental body established as a regional treaty organization in 1967 to promote sustainable fisheries development in Southeast Asia. SEAFDEC currently comprises 11 Member Countries: Brunei Darussalam, Cambodia, Indonesia, Japan, Lao PDR, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Viet Nam.

## Vision

Sustainable management and development of fisheries and aquaculture to contribute to food security, poverty alleviation and livelihood of people in the Southeast Asian region

## Mission

To promote and facilitate concerted actions among the Member Countries to ensure the sustainability of fisheries and aquaculture in Southeast Asia through:
i. Research and development in fisheries, aquaculture, post-harvest, processing, and marketing of fish and fisheries products, socio-economy and ecosystem to provide reliable scientific data and information.
ii. Formulation and provision of policy guidelines based on the available scientific data and information, local knowledge, regional consultations and prevailing international measures.
iii. Technology transfer and capacity building to enhance the capacity of Member Countries in the application of technologies, and implementation of fisheries policies and management tools for the sustainable utilization of fishery resources and aquaculture.
iv. Monitoring and evaluation of the implementation of the regional fisheries policies and management frameworks adopted under the ASEAN-SEAFDEC collaborative mechanism, and the emerging international fisheries-related issues including their impacts on fisheries, food security and socio-economics of the region.
